## **PART I GENERAL OVERVIEW**

### **1. REQUEST FOR APPLICATIONS**

In this announcement, the Institute of Education Sciences (Institute) describes the research grant programs that are funded through its National Center for Special Education Research. Separate announcements are available on the Institute's website that pertain to the postdoctoral research training program and national research and development centers funded through the National Center for Special Education Research and to the discretionary grant competitions funded through the Institute's National Center for Education Research (<http://ies.ed.gov/ncer>).

The Institute of Education Sciences (Institute) invites applications for research projects that will contribute to its Special Education Research Grants Programs on Early Intervention, Early Childhood Special Education and Assessment Research; Mathematics and Science Special Education Research; Reading, Writing, and Language Development Special Education Research; Serious Behavior Disorders Special Education Research; Individualized Education Programs and Individualized Family Service Plans Research; Secondary and Transition Services Research; Autism Spectrum Disorders Research; Response to Intervention Research; and Related Services Special Education Research. For the FY 2008 competition, the Institute will consider only applications that meet the requirements outlined below under the sections on Topics with July 26, 2007 Application Deadline Date; Topics with November 1, 2007 Application Deadline Date; and Requirements of the Proposed Research.

For the purpose of this Request for Applications (RFA), a student with disabilities is defined in Public Law 108-446, the Individuals with Disabilities Education Act of 2004 (IDEA), as a child “(i) with mental retardation, hearing impairments (including deafness), speech or language impairments, visual impairments (including blindness), serious emotional disturbance (referred to in this title as ‘emotional disturbance’), orthopedic impairments, autism, traumatic brain injury, other health impairments, or specific learning disabilities; and (ii) who, by reason thereof, needs special education and related services” (Part A, Sec. 602). An infant or toddler with a disability is also defined in IDEA as, “an individual under 3 years of age who needs early intervention services because the individual (i) is experiencing developmental delays, as measured by appropriate diagnostic instruments and procedures in 1 or more of the areas of cognitive development, physical development, communication development, social or emotional development, and adaptive development; or (ii) has a diagnosed physical or mental condition that has a high probability of resulting in developmental delay” (Part C, Sec. 632).

### **2. OVERVIEW OF THE INSTITUTE'S RESEARCH GRANTS PROGRAMS**

The Institute's over-arching priority is research that contributes to improved academic achievement for all students, and particularly for those whose education prospects are hindered by inadequate education services and conditions associated with poverty, race/ethnicity, limited English proficiency, disability, and family circumstance.

With academic achievement as the major priority, the Institute focuses on outcomes that differ by periods of education. In the infancy and preschool period, the outcomes of interest are those that enhance readiness for schooling, for example, language skills, and for infants and toddlers with disabilities, developmental outcomes. In kindergarten through 12th grade, the core academic outcomes of reading and writing (including reading and writing in the disciplines), mathematics, and science are

emphasized, as well as the behaviors and social skills that support learning in school and successful transitions to employment, independent living, and post-secondary education. At the post-secondary level, the focus is on enrollment in and completion of programs that prepare students for successful careers and lives. The same outcomes are emphasized for students with disabilities across each of these periods, and include the functional outcomes that improve educational and transitional results. The acquisition of basic skills by adults with low levels of education is also a priority.

In conducting research on academic outcomes, the Institute concentrates on conditions within the control of the education system, with the aim of identifying, developing, and validating effective education programs, practices, policies, and approaches as well as understanding the factors that influence variation in their effectiveness, such as implementation. Conditions that are of highest priority to the Institute are in the areas of curriculum, instruction, assessment (including the identification of students with disabilities), the quality of the education workforce, and the systems and policies that affect these conditions and their interrelationships (for example, accountability systems, delivery mechanisms including technology, and policies that support the ability of parents to improve educational results for their children through such means as choice of education services and provision of school-related learning opportunities in the home).

In this section, the Institute describes the overall framework for its research grant programs. Specific information on the research topics described in this announcement may be found in the sections pertaining to each special education research program:

- [Early Intervention, Early Childhood Special Education, and Assessment for Young Children with Disabilities Research](#)
- [Mathematics and Science Special Education Research](#)
- [Reading, Writing, and Language Development Special Education Research](#)
- [Serious Behavior Disorders Special Education Research](#)
- [Individualized Education Programs and Individualized Family Service Plans Research](#)
- [Secondary and Transition Services Research](#)
- [Autism Spectrum Disorders Research](#)
- [Response to Intervention Research](#)
- [Related Services Special Education Research](#)

The Institute addresses the educational needs of typically developing students through its Education Research Grants Programs and the needs of students with disabilities through its Special Education Research Grants Programs. Both the Education Research and the Special Education Research Grants Programs are organized by outcomes (e.g., reading, mathematics), type of education condition (e.g., curriculum and instruction; teacher quality; administration, systems, and policy), grade level, and research goals.

#### **A. Outcomes**

The Institute's research grants programs focus on improvement of the following education outcomes: (a) readiness for schooling (pre-reading, pre-writing, early mathematics and science knowledge and skills, and social development); (b) academic outcomes in reading, writing, mathematics, and science; (c) student behavior and social interactions within schools that affect the learning of academic content; (d) academic and functional outcomes, as well as skills that support independent living for students with

significant disabilities; and (e) educational attainment (high school graduation, enrollment in and completion of post-secondary education).

## **B. Conditions**

In general, each of the Institute's research grants programs focuses on a particular type of condition (e.g., curriculum and instruction) that may affect one or more of the outcomes listed previously (e.g., reading). The Institute's research programs are listed below according to the primary condition that is the focus of the program.

**a. *Curriculum and instruction.*** Several of the Institute's programs focus on the development and evaluation of curricula and instructional approaches. These programs include: (a) Early Intervention, Early Childhood Special Education, and Assessment for Young Children with Disabilities Research, (b) Mathematics and Science Special Education Research, (c) Reading, Writing, and Language Development Special Education Research, (d) Serious Behavior Disorders Special Education Research, (e) Secondary and Transition Services Research, (f) Autism Spectrum Disorders Research, (g) Response to Intervention Research, and (h) Related Services Special Education Research.

**b. *Quality of the education workforce.*** A second condition that affects student learning and achievement is the quality of teachers and education leaders (e.g., principals, superintendents). The Institute funds research that includes approaches, practices, and programs for pre-service or in-service training of teachers or other service providers to deliver instruction or services.

**c. *Administration, systems, and policy.*** A third approach to improving student outcomes is to identify systemic changes in the ways in which schools and districts are led, organized, managed, and operated that may be directly or indirectly linked to student outcomes. The Institute takes this approach in programs including (a) Early Intervention, Early Childhood Special Education and Assessment for Young Children with Disabilities Research, (b) Individualized Education Programs and Individualized Family Service Plans Research, (c) Response to Intervention Research, and (d) Related Services Special Education Research.

Applicants should be aware that some of the Institute's programs cover multiple conditions. Of the programs listed above, these include (a) Early Intervention, Early Childhood Special Education, and Assessment for Young Children with Disabilities Research, (b) Individualized Education Programs and Individualized Family Service Plans Research, (c) Secondary and Transition Services Research, (d) Related Services Special Education Research, (e) Autism Spectrum Disorders Research, and (f) Response to Intervention Research.

## **C. Grade Levels**

The Institute's research programs also specify the ages or grade levels covered in the research program. The specific grades vary across research programs and within each research program, and grades may vary across the research goals. In general, the Institute supports research for (a) pre-kindergarten and kindergarten, (b) elementary school, (c) middle school, (d) high school, (e) post-secondary education, (f) vocational education, and (g) adult education. In addition, the Institute supports research on infants with disabilities.

#### **D. Research Goals**

The Institute has established five research goals for its research programs. Within each research program one or more of the goals may apply: (a) Goal One – identify existing programs, practices, and policies that may have an impact on student outcomes, and the factors that may mediate or moderate the effects of these programs, practices, and policies; (b) Goal Two – develop programs, practices, and policies that are theoretically and empirically based; (c) Goal Three - establish the efficacy of fully developed programs, practices, and policies; (d) Goal Four – provide evidence on the effectiveness of programs, practices, and policies implemented at scale; and (e) Goal Five – develop or validate data and measurement systems and tools.

For a list of the Institute's FY 2008 research grant topics—including research grant competitions through the Institute's National Center for Special Education Research and National Center for Education Research, please see Table 1 below. Funding announcements for these competitions may be downloaded from the Institute's website at <http://ies.ed.gov>.

**Please Note:** Two research topics that have been offered in previous years—Quality of Teachers and Other Service Providers, and Assessment for Accountability—are not offered as separate topics this year. However, applicants may still propose projects in these areas. Projects on the quality of teachers and other service providers may be proposed under the other research topics offered in this Request for Applications. These topics allow interventions involving pre-service or in-service training of teachers or other service providers to be investigated under any of the goals. Projects on assessment for accountability may be proposed as Goal 5 projects under appropriate research topics, as discussed in the section entitled “Requirements for Goal Five (Measurement).” Questions concerning the appropriateness of applications can be directed to the federal contacts listed in the section entitled “Inquiries May Be Sent To.”

#### **Table 1: FY 2008 Research Grant Topics:**

##### **National Center for Special Education Research**

2. Research Training Grant Topics
  - Postdoctoral Special Education Research Training

3. National Research and Development Center Topics
  - Center on Serious Behavior Disorders at the Secondary Level
  - Center on Response to Intervention in Early Childhood Special Education

**National Center for Education Research**

1. Research Grant Topics
  - Reading and Writing
  - Mathematics and Science Education
  - Cognition and Student Learning
  - Teacher Quality – Reading and Writing
  - Teacher Quality – Mathematics and Science Education
  - Social and Behavioral Context for Academic Learning
  - Education Leadership
  - Education Policy, Finance, and Systems
  - Early Childhood Programs and Practices
  - High School Reform
  - Interventions for Struggling Adolescent and Adult Readers and Writers
  - Postsecondary Education
  - Education Technology
2. Research Training Grant Topics
  - Postdoctoral Research Training Program
  - Predoctoral Research Training Program
3. National Research and Development Center Topics
  - Cognition and Science Instruction
  - Instructional Technology

## **PART II RESEARCH GRANT TOPICS**

For the Institute's FY 2008 special education research grant programs, there are two sets of topics; one set has an Application Deadline Date of July 26, 2007, and the other has an Application Deadline Date of November 1, 2007. In this section, the Institute first describes the topics for the July 2007, Application Deadline Date, followed by the topics for the November, 2007 Application Deadline Date.

### **3. TOPICS WITH JULY 26, 2007 APPLICATION DEADLINE DATE**

#### **A. Early Intervention, Early Childhood Special Education, and Assessment for Young Children with Disabilities Research**

*a. Purpose.* Through its Early Intervention, Early Childhood Special Education, and Assessment for Young Children with Disabilities Research Grants Program, the Institute intends to support research that contributes to the improvement of cognitive, linguistic, social, emotional, adaptive, and physical outcomes of infants, toddlers, and young children (from birth through 5) with disabilities or to prevent the development of disabilities by: (a) identifying interventions, curriculum, and instructional practices that are potentially effective for improving cognitive, linguistic, social, emotional, adaptive, and physical needs of infants, toddlers, and young children with disabilities and their families; (b) developing new, or modifying existing, interventions, programs and curricula, including research on appropriate personnel preparation and professional development, to address the cognitive, linguistic, social, emotional, adaptive, and physical needs of infants, toddlers, and young children with disabilities or at risk for disabilities and their families; (c) establishing the efficacy of existing interventions, programs, curricula, personnel preparation, and professional development to address the cognitive, linguistic, social, emotional, adaptive, and physical needs of infants, toddlers, and young children with disabilities or at risk for disabilities and their families; (d) providing evidence on the effectiveness of interventions, programs, curricula, personnel preparation, or professional development that are implemented at scale and designed to address the cognitive, linguistic, social, emotional, adaptive, and physical needs of young children with disabilities or at risk for disabilities and their families; and (e) developing or further validating assessment tools that can be used by practitioners to identify, monitor, or assess the progress and outcomes of infants, toddlers, and young children with disabilities or at risk for disabilities and their families or assess the performance of early intervention and early childhood special education practitioners. Interventions appropriate for development and/or evaluations under this program are interventions intended to improve cognitive, linguistic, social, emotional, adaptive, and physical outcomes of children (birth through five years of age) with disabilities or at risk for disabilities. Interventions may be school-based interventions or occur in natural settings (e.g., home-based, child care settings, family focused interventions) but with improvement in developmental and school readiness outcomes or social-prosocial behaviors. The long-term outcome of this program will be an array of tools and strategies (e.g., assessment tools, curricula, programs, services, interventions) that have been documented to be effective for cognitive, linguistic, social, emotional, adaptive, and physical needs of infants, toddlers, and young children with disabilities or at risk for disabilities and their families.

Applicants must submit under *either* Goal One *or* Goal Two *or* Goal Three *or* Goal Four *or* Goal Five.

**b. Background.** Almost one million infants, toddlers, and young children (birth through five years old) receive Early Intervention and Early Childhood Special Education services under IDEA (U.S. Department of Education, 2005). Guralnick (1988) noted that children and families who received these early intervention services and supports were better off than children and families who received essentially no early intervention services and supports. Many families have noted an improved quality of life for them and their children as well (Bailey, Hebbeler, Spiker, Scarborough, Mallik, & Nelson, 2005).

Research in early intervention addresses complex questions for a heterogeneous population of children across a broad array of developmental, familial, social, cognitive, curricular, delivery, and pedagogical dimensions. This heterogeneity underscores the challenges confronted across not only policy development and service coordination, but also evaluation research (National Research Council [NRC], 2000). In fact, the NRC's Committee on Integrating the Science of Early Childhood Development noted the extent to which this research has suffered from important methodological limitations: "...the empirical knowledge base on the efficacy of early childhood intervention is relatively uneven...Most important in this regard is the extent to which a large proportion of studies that address questions of causality have suffered from inappropriate research designs, inadequate analytic approaches, or both..." (NRC, 2000, p. 342).

In the context of this limited research base, the Institute is continuing its special education research program on early intervention, early childhood special education, and assessment of infants, toddlers, and young children with disabilities. This program will support the development and evaluation of interventions, programs, curricula, and measures intended to address the cognitive, linguistic, social, emotional, adaptive, and physical needs of infants, toddlers, and young children with disabilities, or at risk for disabilities, and their families.

The Institute encourages researchers to develop, modify, or adapt existing interventions, programs, or curricula (including family focused interventions) to meet the needs of infants, toddlers, and young children with disabilities, or at risk for disabilities, and their families and to support the development of school readiness skills. For example, applicants may wish to consider what levels of intensity, specificity, or skill emphasis are necessary to ensure high threshold levels of progress and performance on a range of cognitive, social, functional or developmental outcomes, particularly for young children with biological and metabolic disorders and disabilities who are identified early as a result of recent advances in screening technologies.

In addition, applicants may wish to investigate effective models and programs that coordinate service delivery systems and multiple interventions delivered in classroom, home, or other natural settings; support families and improve child outcomes on multiple measures at different points in children's growth and development; promote effective collaboration among families, service providers, and educators; and provide smooth transitions as children move from Early Intervention services to preschool settings and preschool settings to elementary school.

Applicants may also wish to conduct research on personnel preparation and professional development. For example, researchers may wish to address the question: What features and levels of personnel preparation or professional development (e.g., high and continuous professional development support versus low and incidental professional development support) on what specific pedagogical (e.g.,

structured and teacher directed vs. unstructured and child-centered), curricular (e.g., vertical coverage vs. horizontal coverage of content), and instructional dimensions (e.g., number of modeled examples; small group vs. 1-to-1), at what points in the year, and for what children are most effective in promoting the high quality implementation of curriculum programs for infants, toddlers, and young children with or at risk for disabilities?

In addition, the Institute encourages researchers to develop and/or validate early screening and progress monitoring instruments that can be used by practitioners to identify and monitor infants, toddlers, and young children with disabilities or who are in need of early intervention. Finally, researchers are encouraged to develop and/or validate outcome measures that can be used not only for measuring infants', toddlers', and young children's development and achievement but also for determining program areas that need improvement and for providing data for Federal accountability purposes

## **B. Mathematics and Science Special Education Research**

**a. Purpose.** The Institute intends for the Mathematics and Science Special Education Research Grants Program to fulfill five goals: (1) identifying programs, practices, and policies that are potentially effective for improving mathematics or science outcomes for students with disabilities, as well as mediators and moderators of the effects of these practices; (2) developing new programs and practices in mathematics and science education for students with disabilities; (3) establishing the efficacy of fully developed programs, practices, and policies in mathematics and science education for students with disabilities; (4) providing evidence on the effectiveness of mathematics and science programs, practices, and policies for students with disabilities implemented at scale; and (5) developing and validating assessments of mathematics and science learning for students with disabilities. Mathematics and science programs, practices, and policies may be for students from preschool through high school. Interventions may include programs and practices for pre-service or in-service training of teachers or other service providers to deliver instruction in mathematics or science education for students with disabilities. The long-term outcome of this program will be an array of tools and strategies (e.g., curricula, programs, approaches) that have been demonstrated to be effective for improving mathematics and science learning and achievement.

Applicants must submit under *either* Goal One *or* Goal Two *or* Goal Three *or* Goal Four *or* Goal Five.

**b. Background.** Students with disabilities lag behind their peers without disabilities in both math and science achievement. For example, in the 2005 National Assessment of Educational Progress (NAEP) mathematics assessment, 43 percent of Grade 4 students with disabilities and 17 percent of Grade 4 students without disabilities scored below the basic level. Among Grade 8 students, 68 percent of students with disabilities and 27 percent of students without disabilities scored below the basic level. Among Grade 12 students, 83 percent of students with disabilities and 36 percent of students without disabilities scored below the basic level. In the 2005 NAEP science assessment, 55 percent of the Grade 4 students with disabilities and 30 percent of the Grade 4 students without disabilities scored below basic. At Grade 8, 73 percent of the students with disabilities and 38 percent of the students without disabilities scored below basic in the science assessment. Among Grade 12 students, 83 percent of students with disabilities and 43 percent of students without disabilities scored below basic in science achievement.

These NAEP results and the findings of the National Research Council (1998) reveal that students with disabilities are not gaining access to the content in mathematics and science when compared with students without disabilities. However, students with disabilities can be taught academic content if provided with appropriate and effective instructional interventions designed to meet their unique needs, and research is needed to expand the range of available interventions. Research is also needed to develop assessments of math and science learning for students with disabilities.

Yet, teaching math and science to students with disabilities is complex, because it sits at the intersection of numerous varied systems, each unforgiving in complexity, including, for example: (a) a complex symbolic system (i.e., Arabic numeration system), (b) an all-inclusive administrative system (i.e., preschool, elementary, middle, and high schools), (c) an elaborate expert knowledge system (i.e., teacher knowledge about how to teach math and science skills), (d) a multi-faceted measurement system (i.e., assessing math and science), (e) an intricate neurological and biological system that is naturally invoked in the act of engaging in math and science content (i.e., the human brain), (f) content knowledge comprised of highly specialized information and vocabulary unique to science and mathematics, and (g) a group of learners who have unique instructional design and delivery needs (i.e., students with disabilities).

To improve the math and science skills of students with disabilities, an ambitious and comprehensive program of research is required to examine the efficacy of interventions, curriculum programs, instructional practices and assessment tools in math and science in the context of these selected systems. Questions to be addressed in this program of research include, for example, what levels of *instructional intensity* (e.g., high intensity includes daily levels of frequent and distributed practice on specific math skills or science concepts), *specificity* (highly specified instruction includes explicit teacher scaffolding of verbal support and prompting), or *emphasis* (e.g., basic vocabulary, concepts and facts vs. word problem solving activities) are necessary for improving the math and science skills of students with cognitive disability? What are the critical math or science concepts and the particular cognitive routines that should be taught and learned, at what particular points in a student's individual growth and development beginning in preschool through high school, for what specific social, developmental, and academic purposes and contexts, and to what criterion levels of performance? Which interventions, strategies, instructional practices are most effective for increasing the math problem solving skills of students with disabilities and closing the achievement gap between students with disabilities and their peers?

### **C. Reading, Writing, and Language Development Special Education Research**

**a. Purpose.** Through its Special Education Reading, Writing, and Language Development Special Education Research Grants Program, the Institute intends to contribute to the improvement of reading, writing, and language skills for students with identified disabilities and to prevent the development of disabilities among students at risk for disabilities by (1) identifying curriculum and instructional practices that are potentially effective for improving reading, writing, or language outcomes for students with identified disabilities and students at risk for disabilities as well as mediators and moderators of the effects of these practices; (2) developing interventions or instructional approaches and strategies for teaching reading, writing, or language skills to students with identified disabilities or students at risk for disabilities; (3) establishing the efficacy of existing interventions or instructional approaches and strategies for teaching reading, writing, or language skills to students with identified disabilities or

students at risk for disabilities; (4) providing evidence on the effectiveness of interventions or instructional approaches and strategies for teaching reading, writing, or language skills implemented at scale; and (5) developing and validating reading, writing, or language assessments that can be used in instructional settings. Interventions appropriate for development and/or evaluation under this program are interventions intended to improve reading/pre-reading, writing/pre-writing, or language outcomes of students with disabilities and students at risk for disabilities. Interventions may be for students from kindergarten through grade 12. Interventions may include programs and practices for pre-service or in-service training of teachers or other service providers to deliver instruction in reading and writing for students with disabilities. The long-term outcome of this program will be an array of tools and strategies (e.g., assessments, instructional approaches) that have been documented to be effective for improving reading, writing, or language outcomes for students with identified disabilities and students at risk for disabilities.

Applicants must submit under *either* Goal One *or* Goal Two *or* Goal Three *or* Goal Four *or* Goal Five.

**b. Background.** Students with disabilities do not attain the same performance thresholds as their peers on a range of language, reading, writing, and state outcome measures. For example, the 2005 National Assessment of Educational Progress (NAEP) report indicates that, in fourth grade, 66 percent of students with disabilities who participated scored below the basic level in reading achievement in contrast to 33 percent of students without disabilities. Reading below the basic level means that when reading grade appropriate text, these students cannot extract the general meaning of text, make obvious connections between the text and their own experiences, or make simple inferences from the text. In other words, approximately two-thirds of fourth grade students with disabilities who take the NAEP do not understand what they have read. In writing, a similar picture emerges. The 2002 NAEP writing assessment report indicated that, in fourth grade, 43 percent of students with disabilities who participated scored below the basic level in contrast to 11 percent of students without disabilities. The NAEP results make it very clear that students with disabilities are not gaining comparable access to symbolic systems (e.g., alphabetic writing system) as students without disabilities.

Several noteworthy and comprehensive reading research reviews conducted in the last fifteen years (Adams, 1990; National Research Council, 1998; National Reading Panel, 2000) now make conspicuously apparent the role of oral language (e.g., oral vocabulary) in reading and writing. In the early preschool and primary years, oral language “far outstrips written language” (Kamil & Hiebert, 2005). However, written language quickly takes on an increasingly larger role in literacy than does oral language (Kamil & Hiebert, 2005) as children move from “learning to read” to “reading to learn” (Chall, 1983; Kame’enui, Adams, & Lyon, 1990). The demands of unfamiliar language in both oral and written form exact a range of consequences on the productive (speaking or writing) and receptive language knowledge (listening or reading) of students with disabilities.

Equally important is the simple and well-established empirical proposition that students with disabilities can be taught the essential skills for gaining access to words, the world of ideas, and life-long literacy opportunities. Yet, teaching reading, writing, and language skills to students with disabilities is complex, because it sits at the intersection of numerous varied systems, each unforgiving in complexity, including, for example: (a) a complex symbolic system (i.e., alphabetic writing system), (b) an all-inclusive administrative system (i.e., elementary schools), (c) an elaborate expert knowledge system (i.e., teacher knowledge about how to teach reading, writing, and language skills), (d) a multi-faceted measurement

system (i.e., assessing reading, writing, and language), (e) an intricate neurological and biological system that is naturally invoked in the act of reading, writing, and language (i.e., the human brain), and (f) a group of learners who have unique instructional design and delivery needs (i.e., students with disabilities or at risk for disabilities).

To improve the reading, writing, and language skills of students with disabilities and those at risk for disabilities, an ambitious and comprehensive program of research is required to examine the efficacy of interventions, curriculum programs, instructional practices and assessment tools in reading, writing, and language in the context of these selected systems. Questions to be addressed in this program of research include, for example, what levels of *instructional intensity* (e.g., high intensity includes daily levels of frequent and distributed practice on specific reading skills), *specificity* (highly specified instruction includes explicit teacher scaffolding of verbal support and prompting), or *emphasis* (e.g. phonics vs. vocabulary instruction) are necessary for improving the reading, writing, or language skills of students with cognitive disability? What are the number of words and the particular words that should be taught and learned, at what particular points in a student's vocabulary growth and reading development beginning in kindergarten through high school, for what specific social and academic purposes and contexts, and to what criterion levels of performance? Which interventions, strategies, instructional practices or approaches are most effective for increasing the reading skills of students with disabilities or at risk for a disability that are also English Language Learners? Which interventions, strategies, instructional practices are most effective for increasing the reading skills of students with multiple disabilities? Which interventions, strategies, or instructional practices or approaches are most effective for increasing the reading comprehension skills of students with disabilities or at risk for a disability and closing the achievement gap between students with disabilities and their peers?

Applicants may also be interested in examining professional development programs that are designed to develop a teacher's knowledge about teaching reading to students with disabilities and professional development programs designed around a specific curriculum for students with disabilities, in which the intent is to provide teachers with specific skills, strategies, and perhaps lesson plans for delivering a specific curriculum or intervention. Topics may include what professional development content should be delivered, how it should be delivered, and how teacher knowledge should be assessed.

Through the Reading, Writing, and Language Development Special Education Research Grants Program, the Institute intends to address the range of problems contributing to reading, writing, and language difficulties through the development and evaluation of reading, writing, or language interventions that target the needs of students with identified disabilities and students at risk for developing disabilities and the development and validation of reading, writing, and language assessments for students with disabilities.

#### **D. Serious Behavior Disorders Special Education Research**

**a. Purpose.** The purpose of the Serious Behavior Disorders Special Education Research Grants Program is to contribute to the prevention or amelioration of serious behavior disorders in infants, toddlers, children and youth with disabilities (hereinafter referred to as "children"), and concomitantly, improve the developmental and academic outcomes of children by: (a) Identifying existing programs, practices, and policies that improve the behavior, social, and emotional difficulties of children with disabilities and the conditions that mediate and moderate the effects of such programs, practices, and

policies (e.g., practices that have a positive impact on or are associated with improved student discipline or reduction in special education referrals for behavior problems and the factors that may mediate or moderate the effects of these practices); (b) developing programs that target and ameliorate the behavior, social, or emotional difficulties of children with disabilities; (c) establishing the efficacy of emerging and existing interventions that address the behavior, social, or emotional difficulties of children with disabilities while examining the mediating or moderating variables that impact intervention outcomes on social, emotional and academic performance; (d) evaluating the effectiveness of interventions implemented at scale and under a variety of conditions; and (e) developing and validating assessment tools and procedures, including the “functional behavioral assessments” stipulated in IDEA [Sec. 615 (k) (1)] for use in home, instructional, and non-instructional settings to identify or diagnose social skill deficits or behavior problems, and to monitor the behavior of children with disabilities.

Research programs appropriate for development and evaluation under this research topic are prevention or intervention programs intended to improve social, emotional, or behavioral outcomes of children with disabilities or children at risk for disabilities. Research programs may be school-based, home-based, or family-based. In particular, there is a need for research that combines applied behavioral analysis, functional behavioral analysis, or positive behavior support approaches with approaches from the research literature in prevention science and children’s mental health services (e.g., social-behavioral ecology, social learning, coordinated interagency services). Such programs of research should target developmental factors that have been shown to contribute to the establishment and maintenance of behavior disorders in children (e.g., Coie & Dodge, 1998; Farmer, Quinn, Hussey, & Holahan, 2001; Walker & Sprague, 1999). In addition, intervention appropriate for research under this program include approaches, practices, strategies, programs, and systems for pre-service or in-service training of teachers or other service providers to deliver instruction or services to students with serious behavior disorders. The long-term outcome of this program will be an array of tools and strategies (e.g., assessment tools and interventions/strategies) that have been documented to be effective for preventing behavior disorders and improving the behavioral, emotional, social skills, and likewise, the developmental trajectory and academic performance of children with disabilities ages 0-21 years.

Applicants must submit under *either* Goal One *or* Goal Two *or* Goal Three *or* Goal Four *or* Goal Five.

**b. Background.** Research on the efficacy of behavioral interventions and supports designed to manage, control, and prevent a range of behavior and antisocial problems (e.g., violence toward peers or adults, self-injury, noncompliance, bullying, withdrawal, truancy) in a range of settings (e.g., school, general and special education classrooms, home, work, community) is historically robust (Baer, Wolf, & Risley, 1968; Becker, Madson, Arnold, & Thomas, 1967; Safran & Oswald, 2003; Sugai, et al., 2000). The extant research on behavioral interventions and support provides practitioners with a reasonable set of tenets derived from applied behavior analysis to guide the selection, application, and extension of behavior interventions and supports for students with disabilities, including, for example: (a) the clear and incontrovertible proposition that punishment and exclusion are ineffective when used singularly and in the absence of a proactive positive behavioral support system (Sugai & Horner, 2002); (b) an emerging but steady convergence of empirical support for the proposition that problem behaviors may be reduced with high quality implementation of explicit and systematic instruction designed and delivered to meet the needs of students with disabilities (e.g., Lee, Sugai, & Horner, 1999; Lane, Menzies, Munton, Von Duering, & English, 2005); (c) the well-established reliance on functional assessment strategies that emphasize ongoing, direct measurement of socially important behavior (Carr,

et al., 2002); (d) the comprehensive development, adoption, and promotion of a systemic, proactive approach to managing problem behaviors marking a significant departure from traditional use of aversive, reactive, crisis-response strategies as the primary intervention to problem behaviors (Carr, Robinson, Taylor, & Carlson, 1990). Moreover, there appears to be general agreement among advocates, policymakers, stakeholders, researchers, and practitioners alike on the importance and need for the development and implementation of a “comprehensive research agenda” that emphasizes prevention of problem behavior and the “development of the emotional and coping competencies that minimize problem behaviors,” while also promoting a “commitment to improved quality of life” and the “reduction of dangerous, destructive, and harmful behaviors” (Horner, Dunlap, Beasley, Fox, Bambara, Brown, et al., 2005, p. 5).

Although current research literature appears to provide the field with important and promising guidance on behavioral interventions and support, much “mopping up” (Kuhn, 1962) remains to be done in order to understand and advance the application, scalability, and sustainability of a range of behavioral interventions and supports. In other words, gaps in research on behavioral interventions and supports for children with disabilities suggest the need for a rigorous, developmental program of research that, for example, documents the nature and essential elements of behavioral interventions and supports that address a range of (a) ages and disabling conditions among children with or at risk of behavior problems, (b) settings (e.g., home, school, community) and contexts (e.g., classroom, school building, playground), (c) demand conditions (e.g., social, familial, academic), and (d) intervention agents (e.g., teachers, mental health professionals). It is in this context that the Institute continues its special education research program on Serious Behavior Disorders.

Research funded through this program must account for a range of technically sound criterion performance measures (e.g., developmental milestones, academic achievement outcomes, prosocial behavior outcomes, progress monitoring of academic performance, proactive communication protocols) employing multiple response forms (e.g., choice, production, physical responses) across multiple levels of implementation (e.g., high vs. low implementation models) and tiers of prevention (i.e., primary, secondary, tertiary) with an explicit and systematic focus on evaluating the maintenance and generalization of outcomes to scalable levels and systems (e.g., school-wide vs. district-wide vs. state-wide). In addition, such a program of research must describe patterns of strengths and weaknesses in behavioral prevention, interventions, and supports for selected groups of children with disabilities.

The Institute is particularly interested in research to develop programs, policies, and interventions that combine the disciplines of special education and mental health with the goal of preventing emotional and behavioral disorders and improving the academic outcomes for children with behavior disorders. Considerable work focusing on interventions that are aimed at preventing or ameliorating serious behavior disorders in children and youth has been conducted in the areas of developmental psychopathology, prevention research, and children’s mental health services. Much of this work focuses on improving social and behavioral functioning in schools and other community settings, yet there has been relatively little systematic effort to bridge these efforts with prevention and intervention research in special education. Research that bridges these areas is particularly important given that the Great Smokey Mountain Study found that approximately 20% of students with serious behavior disorders received specialty mental health services, yet nearly 60% of parents (or the child him or herself) perceived that the child had a problem that needed help (Farmer, Mustillo, Burns, & Costello, 2005).

The Institute also encourages researchers to consider, for example, tailoring programs developed in children's mental health aimed at preventing behavior and mental health disorders (e.g., conduct disorder) and the impact of those programs on school-based behavior and academic outcomes, including referral and classification for special education for behavior disorders. Researchers may be interested in addressing questions such as: How can the interventions developed by disciplines outside of special education be tailored to the particular types of social, emotional, behavioral, and academic deficits exhibited by students or young children with or at-risk of behavior disorders? How can theories from various disciplines (e.g., social-behavioral ecology) inform and improve special education intervention development? How can coordination of services across various agencies and disciplines (e.g., education, mental health) improve outcomes for students with or at-risk of SBD?

Finally, other types of research needed include, but are not limited to, the following questions. Which components, elements, or "active ingredients" of interventions and supports, when implemented as part of a comprehensive system of prevention (e.g., primary, secondary, tertiary) in a range of complex but typical settings (e.g., home, school) by a variety of intervention agents, are experimentally linked to enhancing, promoting, and sustaining positive social and academic outcomes for school-aged students with disabilities? How can functional behavioral assessments be designed, conducted and used to develop and monitor the effectiveness of positive behavioral interventions? What are the critical social and emotional skills that function as mediators or moderators for negative in-school outcomes such as disciplinary actions, restrictive placement decisions, or academic failure? How can these skills best be taught in school?

#### **E. Individualized Education Programs and Individualized Family Service Plans Research**

*a. Purpose.* Through its program of research on Individualized Education Programs and Individualized Family Service Plans (IEP/IFSP Research), the Institute intends to contribute to the improvement of education for infants, toddlers, children, and students with disabilities by (1) identifying practices, programs, or systems designed to improve the creation, implementation, and monitoring of appropriate and effective individualized education programs (IEPs) and individualized family service plans (IFSPs) for infants, toddlers, children, and students with disabilities; (2) developing practices, programs, or systems designed to enhance the abilities of education practitioners, administrators, and service providers to create, implement, and monitor appropriate and effective IEPs and IFSPs for infants, toddlers, children, and students with disabilities (3) determining the efficacy of practices, programs, or systems designed to improve the use of IEPs and IFSPs through efficacy or replication trials; and (4) providing evidence on the effectiveness of practices, programs, or systems designed to improve the use of IEPs and IFSPs when implemented at scale. The long-term outcome of this program will be an array of programs, practices, and systems that have been documented to be effective for providing services for infants, toddlers, and children in natural environments (including the home) and community settings in which children without disabilities participate, as well as ensuring that students with disabilities have access to, participate in, and make progress in the general education curriculum in the least restrictive environment.

For the purpose of this research program, an "individualized education program" is defined and fully specified in Part B, Section 614(d) of the "Individuals with Disabilities Education Act," and an "individualized family service plan" is defined and fully specified in Part C, Section 636 of the "Individuals with Disabilities Education Act."

Applicants must submit under *either* Goal One *or* Goal Two *or* Goal Three *or* Goal Four *or* Goal Five.

**b. Background.** The Individuals with Disabilities Education Act (IDEA) requires that education practitioners and service providers, in collaboration with parents (and older students), develop an Individualized Education Program (IEP) and an Individualized Family Service Plan (IFSP) for each infant, toddler, child, or student with a disability in order to meet the unique needs of a child, or, in the case of an IFSP, the unique needs of a child and family. IEPs and IFSPs are viewed as the foundation for ensuring that the particular “individualized” needs of infants, toddlers, children, and students with disabilities who require special education or early intervention services are met in the classroom (for IEPs) or natural settings (for IFSPs) through a range of evidence-based instructional, curricular, social, and behavioral strategies, interventions, and programs. While the concept of IEPs and IFSPs is simple and straightforward – to ensure that infants’, toddlers’, children’s’, students’ and families’ (for IFSPs) unique needs are met on a daily basis -- the development and implementation of appropriate, meaningful, and effective IEPs and IFSPs for infants, toddlers, children, and students with disabilities in classrooms, schools, and natural settings are extraordinarily complex. Appropriate and meaningful IEPs are based, in part, on (a) accurate assessments of the child's present levels of academic achievement and functional performance; (b) an explication of how the child’s disability affects the child’s involvement and progress in the general education curriculum or a preschool child’s participation in appropriate activities; (c) measurable academic and functional goals that are linked to state and local academic standards; (d) clear descriptions of how and when the child's progress toward meeting the annual goals will be measured; (e) a description of benchmarks or short-term objectives for children with disabilities who take alternate assessments aligned to alternate achievement standards; and (f) an informed understanding, based on the best available information and peer-reviewed research evidence, of the special education and related services and supplementary aids and services that will enable the child to reach those goals.

IFSPs contain content similar to that of IEPs; however, they include statements on: (a) the infant or toddler’s present levels of development in multiple domains; (b) the family’s resources, priorities, and concerns related to enhancing the development of the infant or toddler; (c) measurable results and outcomes for the infant or toddler and his or her family; (d) the features of the natural environments in which services will be provided; (e) timelines for providing services; (f) the identification of the service coordinator; and (g) steps to support transition to preschool or other appropriate services.

Given the complexity of IEP and IFSP content, the full range of disabilities and developmental delays, and the unique needs of each child and/or family, the enormity of the task that IEP and IFSP teams face is clear. Although the challenges to the development, implementation, and evaluation of appropriate and effective IEPs and IFSPs for infants, toddlers, children, and students with disabilities are substantial, the rigorous research evidence to support the development and implementation of IEPs and IFSPs is relatively thin. It is in this context that the Institute of Education Sciences (IES) has launched its IEP/IFSP Research program. The Institute encourages proposals to develop and evaluate practices, programs, or systems to improve IEP and IFSP development, implementation, and evaluation; including meaningful family and student involvement in this process; and facilitating collaboration among school leadership and personnel (e.g., general educators, special educators, school psychologists). For example, applicants might consider professional development that focuses on assessment, curriculum and service planning, intervention strategies, and goal setting that target specific disabilities and

developmental delays, promote skill acquisition, and bring to bear rigorous evidence in these areas. Such professional development might address issues such as: (a) the type of instruction and interventions required to meet the infant's, toddler's, child's, or student's unique needs and ensure that services to infants, toddlers, and children are provided in natural environments and community settings, and that students with disabilities gain access to and participate in the general education curriculum in the least restrictive environment; (b) strategies or programs for addressing specific academic and functional goals that are linked to state and local academic standards; and (c) the frequency with which progress should be monitored. In-service training might also help members of the IEP or IFSP team to better understand and utilize research on intervention, as well as the current research on a targeted disability, and the unique needs of the infant, toddler, child, or student and his or her family. In addition, applicants might develop and test systems for managing and monitoring the IEP and IFSP processes. Such systems might include (a) strategies for improving the decision-making process in the development and specification of components of the IEP or IFSP, including standards-based or standards-referenced goals; (b) approaches for promoting the active and meaningful engagement of parents in the development and implementation of IEPs and IFSPs; and (c) ways to assess the fidelity of the implementation of the IEP or IFSP. Applicants might also examine the extent to which frequent monitoring of infant, toddler, child or student progress (e.g., once a week, twice a month) and the reporting of results to parents or guardians on an equally frequent basis that improves performance and progress on state outcome measures and the overall development and validation of the IEP and IFSP.

The Institute also encourages proposals to develop and validate templates for IEPs and IFSPs that are appropriate for specific disabilities and developmental delays yet flexible for individualizing the IEP or IFSP according to the unique needs of each infant, toddler, child, or student with a disability. The templates would provide prototypical IEPs and IFSPs for infants, toddlers, children, and students with specific disabilities or developmental delays and who test within a specified range on relevant assessments. For example, a template for a third grade student with a learning disability who is greater than 2 years behind grade level standards in reading may identify: (a) appropriate goals, including those that are tied to state achievement standards under No Child Left Behind, and from which users could select those most relevant to the target child, (b) short-term objectives or benchmarks for each goal, including suggestions of measures to use in monitoring progress, including guidance on the timing and frequency of such assessments, and (c) strategies or services that enable the child to reach each goal, including suggestions for how (and where) those services might best be provided (e.g., settings in which such services could be delivered). The goal would be to provide IEP and IFSP teams with clear guidelines and standard protocols that are based on the most rigorous special education and early intervention research designed to serve as the foundation for developing IEPs and IFSPs tailored to meet the unique needs of individual children.

The Institute also encourages proposals designed to study and improve critical elements of IEPs and IFSPs. This research, for example, would include, an analysis and examination of "specially designed instruction" (SDI), particularly how "specially designed instruction" is defined in an IEP, implemented in the actual service delivery setting (e.g., general or special education classroom), and evaluated for specific disability categories at defined age/grade levels (e.g., K-1 vs. 3-4 vs. 7-8 vs. High School – Transition) and academic skill and content areas (e.g., beginning reading, language, mathematics, science) as specified in IDEA. Similarly, a researcher may wish to investigate how IDEA's definition of special education as "specially designed instruction" is translated and applied to developmental services as required in an IFSP, and provided in natural settings (e.g., home or community settings), and

evaluated for specific disability categories at defined ages and developmental outcomes (e.g., physical development; cognitive development, adaptive development, etc.). Such a program of research might examine, for example, the selection of IEPs or IFSPs that are representative of “specially designed instruction” or “specially designed” developmental services as originally designed and intended by the IEP and IEP team or IFSP and IFSP team, then actually implemented in the specified setting, then subsequently enhanced based on the results of the child’s performance on IEP or IFSP goals, and coupled with modifications informed by the current rigorous research, and finally implemented again to determine its impact on academic, social, and functional outcomes associated with the goals of the IEP or IFSP. To address these issues, IES seeks the development of rigorous research to develop and examine the efficacy of selected “specially designed instruction” and “specially designed” developmental services approaches, models, protocols or combinations of interventions and services (e.g., research-based SDI or field-based SDI) designed to improve the social and academic or school readiness outcomes of children with disabilities.

For all interventions, applicants should bear in mind that the ultimate purpose is to determine whether or not implementation of the intervention leads to improved infant, toddler, child, and student outcomes.

#### **4. TOPICS WITH NOVEMBER 1, 2007 APPLICATION DEADLINE DATE**

##### **A. Secondary and Transition Services Research**

*a. Purpose.* The overarching purpose of the Research Grants Program on Secondary and Transition Services is to contribute to the improvement of secondary and transition programs and outcomes for secondary (middle school and high school) students with disabilities. These outcomes include the behavioral, social, communicative, functional, occupational, and academic skills that enable young adults with disabilities to obtain and hold meaningful employment, live independently, and obtain further education and training. Through the Secondary and Transition Services Research Grants Program, the Institute intends to support research to: (a) identify curricula, instructional approaches, transition services, programs, or systems that are potentially effective for improving the academic or functional skills of students with disabilities in secondary (middle school and high school) settings as well as mediators and moderators of the effects of these practices; (b) develop interventions to improve the academic and transition outcomes of students with disabilities in secondary settings; (c) establish the efficacy of existing interventions for improving the education and transition outcomes of students with disabilities in secondary settings; (d) provide evidence on the effectiveness of interventions for improving the education and transition outcomes of students with disabilities in secondary settings when implemented at scale; and (e) develop and validate measures that assess skills predictive of successful education and transition outcomes for students with disabilities in secondary settings. Interventions appropriate for research under this program are secondary-school-based interventions and home-based or community-based interventions that are integrated and intended to support adolescents' abilities to hold competitive employment, obtain further education and training, and successfully transition to independent living. Projects may study students with disabilities at post-secondary levels (e.g., students no longer eligible for services under IDEA due to graduation or age-out) only if the purpose is to improve services and interventions at the secondary level. Interventions may also include approaches, practices, and programs for pre-service or in-service training of teachers or other service providers to deliver secondary or transition instruction or services to students with disabilities. The long-term

outcome of this program will be an array of tools and strategies (e.g., intervention programs, strategies, approaches) that have been documented to be effective in improving the secondary education and transition outcomes for students with disabilities.

Applicants must submit under *either* Goal One *or* Goal Two *or* Goal Three *or* Goal Four *or* Goal Five.

**b. Background.** Education practitioners and policymakers face considerable challenges in improving secondary and transition outcomes for students with disabilities. According to recent reports from the National Longitudinal Transition Study-2 (Wagner, Marder, et al., 2003; Wagner, Newman, et al., 2005), a study of a nationally representative sample of adolescents across the disability categories, students' grade-level equivalent performance on standardized achievement tests was on average about 3.6 years behind grade level in reading and mathematics. Among those individuals who were no longer in school, about 28 percent had dropped out prior to receiving a diploma. In addition, a significant minority experienced social and behavioral problems (e.g., about 17 percent were reported to have difficulty controlling their behavior in class; about 13 percent had been arrested). In the first years after high school, individuals with disabilities were much less likely to attend postsecondary education than were individuals without disabilities. About 21 percent of youth with disabilities were not engaged in their community either through postsecondary education, job training, or work in the first years after high school.

The Institute's Secondary and Transition Services Research Grants Program is intended to address the challenges for improving the secondary and transition outcomes of students with disabilities. This program of research includes research targeted in middle and high schools designed to determine the effectiveness of education interventions or programs for students with disabilities, as well as efforts to support and promote the effective transition from high school to the world of work, independent living, and further education and training. Within middle and high schools, the Institute is interested in research that addresses topics such as, but not limited to (a) the use of assistive, electronic, and information technologies to improve instruction; (b) the design and implementation of differentiated instruction; and (c) the adoption and implementation of secondary education curricula and materials that feature universal designs and architectures that permit meaningful access to rigorous and challenging academic and vocational content. Within the topic of transitions, the Institute is interested in research that addresses topics such as, but not limited to (a) the development and evaluation of secondary-school-based interventions that promote functional skills that would allow young adults with disabilities to obtain and hold jobs and to live independently; (b) systemic interventions to improve transitions for students with disabilities that increase collaboration between school and community agencies, provide professional development for both, and implement a range of strategies to facilitate the transition for youth with disabilities to the world of work or to post-secondary education and training; (c) the development and evaluation of effective community-based programs that promote daily living and employment skills for students with disabilities; and (d) the development and validation of measures of social, behavioral, functional, and cognitive skills that are predictive of successful post-secondary transitions for secondary students with disabilities. Of particular interest is the study of effective transition strategies and programs for low incidence disabilities, as well as the explicit focus on transition as a goal for high incidence disabilities.

## **B. Autism Spectrum Disorders Research**

**a. Purpose.** The purpose of the Autism Spectrum Disorders Research Grants Program is to contribute to the improvement of cognitive, communicative, academic, social, behavioral, outcomes of children identified with autism spectrum disorder (ASD) in preschool through middle school by (a) identifying comprehensive pre-school and school-based interventions that improve cognitive, communicative, academic, social, and behavioral outcomes of children identified with ASD in preschool through middle school and the factors that mediate and moderate the effects of such interventions; (b) developing new, or modifying existing comprehensive pre-school and school-based interventions to address the cognitive, communicative, academic, social, and behavioral needs of children identified with ASD in preschool through middle school; (c) establishing the efficacy of existing comprehensive pre-school and school-based interventions for children identified with ASD in preschool through middle school; and (d) developing and validating measures in cognitive, communicative, academic, social, and behavioral skills that can be used in instructional and non-instructional settings to monitor progress and evaluate outcomes for children identified with ASD in preschool through middle school.

Interventions appropriate for development and/or evaluation under this program are comprehensive pre-school and school-based interventions intended to improve the cognitive, communicative, academic, social, and behavioral outcomes of children identified with ASD in preschool through middle school. Interventions appropriate for research under this research program are comprehensive pre-school and school-based interventions and home-based or clinic-based interventions that are integrated with comprehensive pre-school and school-based interventions and intended to enable and promote children's success in academic and non-academic settings. The long-term outcome of this program will be an array of tools and strategies (e.g., intervention programs, strategies, approaches) that have been documented to be effective for improving the cognitive, communicative, academic, social, and behavioral needs of children identified with ASD in preschool through middle school.

Applicants must submit under *either* Goal One *or* Goal Two *or* Goal Three *or* Goal Five.

**b. Background.** The prevalence rate of children identified with an ASD has increased dramatically over the last decade. In 1992, approximately 15,302 children between the ages of 6 and 21 were identified with autism. In 2004, approximately 165,662 children between the ages of 6 and 21 were identified with autism (U.S Department of Education, n.d.). The unprecedented increase in reported incidence rates within the past decade has created an extraordinary demand on schools to provide interventions that meet the unique educational needs of children identified with ASD. However, the highly variable cognitive and behavioral phenotype associated with ASD creates a significant challenge in developing and implementing effective interventions in a pre-school and school-based setting. For example, research has demonstrated that children identified with ASD have markedly different outcomes and response profiles to different intervention programs (Bryson, Rogers, & Fombonne, 2003; Lord & McGee, 2001; Sherer & Schreibman, 2005). To date, there is not a clear understanding of how child, family, and other environmental variables mediate and moderate the effects of an intervention. Such information is critical in order to “match” a child to an appropriate and effective intervention designed to maximize a child’s academic and functional outcomes. To add to the complexity of developing and implementing interventions to address the unique needs associated with ASD, secondary diagnoses are usually present such as mental retardation or a speech and language disability.

Components of an intervention that facilitate the development of skills in children identified with ASD (e.g., opportunities to interact with peers without disabilities to promote social learning) have advanced over the last decade, yet a significant amount of work remains. From the extant research literature, several conclusions can be drawn about interventions for children identified with ASD. First, interventions have not been rigorously evaluated (Bryson et al., 2003; Lord & McGee, 2001; Wolery, 2000; Volkmar, Lord, Bailey, Schultz, & Klin, 2004). Methodological issues such as ambiguous inclusion and exclusion criteria, lack of outcome measures for generalized treatment effects, and inadequate information regarding fidelity of implementation have made prior intervention studies difficult to evaluate, replicate, and synthesize. Therefore, it is difficult to determine from the existing research what intervention works for whom, at what levels of intensity, for how long, and under what kinds of instructional or organizational conditions. Second, despite the methodological issues with prior research, there is consensus among experts that intervention programs implemented as early as possible can lead to significantly improved outcomes, both short and long term, in a variety of academic and functional domains (Bryson et al., 2003; Dawson, & Osterling, 1997; Lord & McGee, 2001; Volkmar et al., 2004). Third, the effectiveness of a particular intervention cannot be ascribed to a particular pedagogical or theoretical perspective or orientation. Rather, effective intervention programs all appear to have common “key” elements, such as standardized curriculum, transition planning, and highly supportive teaching environments with generalization strategies (Dawson, & Osterling, 1997; Lord & McGee, 2001; Sherer & Schreibman, 2005; Volkmar et al., 2004). However, further research is needed to identify, define, and evaluate these “key” elements across development of children with ASD. Finally, and perhaps most critical, is that many interventions that have demonstrated promise in improving outcomes for children with ASD have been developed and implemented in specialized settings. It is not known whether such interventions can be translated and demonstrate similar improved outcomes for children with ASD in a non-specialized setting (e.g., public school).

In the context of this limited research base, the Institute initiates its ASD Research Grants Program. This program will support the development and evaluation of comprehensive school-based interventions intended to address the cognitive, communicative, academic, social, and behavioral needs of children identified with ASD in preschool through middle school. The Institute encourages researchers to develop or adapt existing interventions to meet the needs of children identified with ASD in preschool through middle school. Researchers may consider, for example, what levels of *intensity* (e.g., number of functional and developmentally relevant opportunities for active response), *specificity* (e.g., highly specified instruction includes explicit teacher scaffolding of support and prompting), or *emphasis* (e.g., academic outcomes vs. academic/functional outcomes) are necessary to ensure high threshold levels of performance on a range of cognitive, academic, social, behavioral, or developmental outcome measures. Other questions that require attention include, for example: What child (e.g., developmental age, language skills), family (e.g., perceived support), and/or environmental (e.g., structured, natural) variables mediate and moderate an intervention? What are the key components or elements of an intervention program in a range of complex but typical settings (e.g., home, school) that are experimentally linked to enhancing, promoting, and sustaining functional and academic outcomes for children with ASD? In addition, the Institute encourages researchers to develop and/or validate cognitive, communicative, academic, social, and behavioral measures or measurement systems designed to monitor progress and/or evaluate outcomes, particularly generalization and maintenance, for children identified with ASD in preschool through middle school.

### C. Response to Intervention Research

**a. Purpose.** The purpose of the Response to Intervention (RTI) Research Grants Program is to support research that contributes to the improvement of instruction for students with disabilities and to the prevention of inappropriate identification of specific learning disabilities by: (1) identifying RTI practices, programs, or systems that are potentially effective for improving instruction for students with disabilities and preventing the inappropriate identification of students with specific learning disabilities, as well as mediators and moderators of the effects of these practices, programs, or systems; (2) developing RTI practices, programs, or systems for improving instruction for students with disabilities and preventing the inappropriate identification of students with specific learning disabilities; (3) determining the efficacy of RTI practices, programs, or systems designed to improve instruction for students with disabilities and prevent the inappropriate identification of students with specific learning disabilities through efficacy or replication trials; (4) providing evidence on the effectiveness of RTI practices, programs, or systems designed to improve instruction for students with disabilities and prevent the inappropriate identification of students with specific learning disabilities when implemented at scale; and (5) developing and validating RTI assessment tools and procedures that can be used to evaluate instruction, measure student initial and ongoing performance and progress, and accurately identify students eligible for special education. Proposed practices, programs, and systems may involve students from preschool (ages 3-5) through high school. The long-term outcome of this program will be an array of RTI practices, programs, and systems that have been documented to improve instruction for students with disabilities and to prevent the inappropriate identification of students with specific learning disabilities.

Applicants must submit under *either* Goal One *or* Goal Two *or* Goal Three *or* Goal Four *or* Goal Five.

**b. Background.** Recent Federal initiatives, such as the President's Commission on Excellence in Special Education Report (2002) and the Office of Special Education Programs' (OSEP) Learning Disabilities Initiative (Bradley & Danielson, 2004) have articulated the growing dissatisfaction with the ability-achievement discrepancy method for identifying students with specific learning disabilities and have recommended the use of a Response to Intervention (RTI) approach. Moreover, the reauthorization of the Individuals with Disabilities Education Act (IDEA, 2004) contains specific authority that allows local education agencies to discontinue use of the ability-achievement discrepancy method and to use RTI as part of the evaluation procedure for identifying students with specific learning disabilities [PL 108-446, Part B, Sec 614(b)(6)(b)]. In contrast to the ability-achievement discrepancy method, RTI has the potential to (1) identify students with specific learning disabilities earlier and more reliably, (2) reduce the number of students who are referred inappropriately to special education, and (3) reduce the overidentification of minority students placed in special education (National Joint Committee on Learning Disabilities, 2005).

RTI holds significant promise when it is conceptualized as a multi-tiered (typically three-tiers) systems approach that integrates general and special education services. The tiers are typically designed to improve instruction for all students in the classroom and provide interventions and supports to students who are struggling in schools. In recognition of prevention goals and priorities to promote the health, education, and well being of children, Caplan and Grunebaum (1967) first advanced the formulation of levels of prevention by differentiating between primary, secondary, and tertiary levels of prevention (Simeonsson, 1994). When adapted and applied to children's well being in school systems and the

prevention of school failure, Tier 1, primary level, is conceived of as including a scientifically based core curriculum that is provided to all students in general education. It also involves an initial screening of academic skills and ongoing progress monitoring of all students to determine whether students are reaching critical benchmarks, including those that are predictive of future success, in a particular domain and whether instructional modifications are needed. Tier II, secondary level, is designed to address the needs of students who are not making adequate progress in the general education classroom, as indicated through frequent (i.e., weekly or biweekly) progress monitoring, and, therefore, require more targeted and differentiated supplemental instruction and support that enhance the Tier 1 core curriculum. Tier III, tertiary level, targets individual students who require intervention that is more intensive than the support provided in Tier II (i.e., more opportunities to respond that may require small group instruction outside of the classroom, often 5 days per week). In addition to reducing the number of new cases (incidence) of students with specific learning disabilities, the multi-tiered model is intended to reduce the duration (prevalence) of and complications associated with existing cases (Simeonsson, 1994).

Despite the preference for RTI, the empirical research to support its application to district and school practices and systems is very limited, particularly in areas other than beginning reading. Therefore, many questions concerning the application of RTI in a three-tiered systems model at the student, classroom, age or grade, school building, and district levels including key issues regarding its operationalization and implementation require a systematic program of research. It is in this context that the Institute continues its RTI Research Grants Program.

The Institute encourages applicants to consider which features of instruction and assessment are most effective for improving students' learning trajectories and determining whether a student is unresponsive to instruction or intervention and requires further evaluation. Examples of instructional features include the systematic and experimental research application of RTI: (a) across the full range of school curricula and content areas at the preschool, primary, elementary and secondary schooling levels; (b) in which empirically established interventions are implemented with high fidelity in various combinations involving a range of task and under performance conditions within a three-tiered framework across the full range of grade levels or age groups; (c) across all levels of *instructional intensity, frequency, and duration* (e.g., *high, moderate, or low levels of intensity, frequency, and duration in the presentation of stimuli and opportunities to respond within fixed or varied amounts of instructional time*); and (d) across a range of measures designed for initial screening and progress monitoring.

Additionally, applicants may wish to conduct research on the implementation of RTI as a system at the district and/or school levels that invokes a range of variables (e.g., administration, management, accountability systems). In particular, applicants may wish to examine the district and/or school's approach to (a) allocating resources aligned with a three-tier system and prioritized according to student outcomes and results; (b) defining district or school leadership and personnel (e.g., general educators, special educators, school psychologists) roles and facilitating collaboration, communication, and cooperation among staff within an RTI system; (c) providing ongoing staff support and effective professional development opportunities as defined within a three-tiered system; (d) integrating general and special education systems to permit the seamless delivery of services to meet well-defined instructional goals and objectives; (e) defining flexibility of the tiers to optimize student performance and efficient use of resources; (f) establishing procedures for moving children across tiers within a grade level and across tiers from grade level to grade level (e.g., third grade to fourth grade) and school to school (e.g., elementary school to middle school); and (g) using student progress monitoring data

gathered within an RTI system for making special education eligibility determinations. Applicants interested in conducting research on RTI for children in preschool settings may also wish to study collaborative approaches that partner teachers, parents, and other service providers and result in children's improved school readiness skills and early school success.

The Institute also encourages applicants to conduct research on measures that assess the fidelity of implementation of tiers of instruction or intervention and the RTI system as a whole. In addition, applicants may wish to conduct longitudinal research on measurement strategies that, when utilized within an RTI framework, accurately predict students' risk for specific learning disabilities. Applicants may wish to give special attention to how the accuracy of risk prediction is affected by (a) the assessment approaches (i.e., static, dynamic, progress monitoring) or combination of assessment approaches implemented within a classroom or school; (b) the measures administered and skills assessed within a specified domain at particular grade levels and times of the school year; and (c) decision rules for defining cut-scores and statistical techniques for analyzing student performance data that determine "nonresponsiveness," predict future difficulties, and result in acceptable levels of *sensitivity* (e.g. indicates percent of children who will be identified as having a specific learning disability out of all the children who actually have one), *specificity* (e.g. indicates percent of children who will be identified as not having a specific learning disability out of all of the children who do not have one), *false positive rates* (e.g., indicates percent of students who will be identified as having a specific learning disability out of all the children who actually do not have one), and *false negative rates* (e.g. indicates the percent of children who will be identified as not having a specific learning disability out of all of the children who actually do have a specific learning disability).

#### **D. Related Services Special Education Research**

**a. Purpose.** The purpose of the Related Services Special Education Research Grants Program is to contribute to the improvement of physical, cognitive, communication, social/emotional, adaptive, and academic outcomes of infants, toddlers, young children, and students (hereafter referred to as "children") who receive special education and related services by: (1) identifying related services practices, programs, and delivery systems that are potentially effective for children with disabilities; (2) developing related services practices, programs, and delivery systems for children with disabilities; (3) determining the efficacy of related services practices, programs, and delivery systems for children with disabilities; (4) providing evidence on the effectiveness of related services practices, programs, and delivery systems for children with disabilities when implemented at scale; and (5) developing and validating assessment tools and procedures that can be used to evaluate physical, cognitive, communication, social/emotional, adaptive, and academic outcomes of children with disabilities who receive special education and related services.

Related services that may be studied under this research program include the following, as defined in §300.34 of the Part B regulations to the 2004 reauthorization of IDEA: speech-language pathology and audiology services, interpreting services, psychological services, physical and occupational therapy, early identification and assessment of disabilities in children, counseling services, including rehabilitation counseling, orientation and mobility services, social work services in schools, and parent counseling and training.

Practices, programs, service delivery systems, strategies, and interventions appropriate for evaluation and/or development under this program are those designed to improve physical, cognitive, communication, social/emotional, adaptive, and academic outcomes of children (birth through grade 12). To the maximum extent appropriate, related services should be studied and provided in natural environments, including school, home, and community settings where children without disabilities also participate. Depending on the population, appropriate practices, programs, service delivery systems, strategies, and interventions may occur in academic settings (e.g., general education classroom, special education classroom, self-contained classroom, etc.) or in natural settings (e.g., home-based, community-based, childcare settings, clinics, etc.). Interventions appropriate for research under this program also include approaches, practices, strategies, and programs for pre-service or in-service training of teachers or other service providers to deliver related services. The long-term outcome of this program will be an array of tools and strategies (e.g., assessment tools, services, curricula, programs, practices, interventions) that have been documented to be effective in improving the physical, cognitive, communication, social/emotional, adaptive, and academic outcomes of infants, toddlers, young children, and students with disabilities.

Applicants must submit under *either* Goal One *or* Goal Two *or* Goal Three *or* Goal Four *or* Goal Five.

**b. Background.** The provision of special education and in particular, related services, is an integral part of a free and appropriate public education for children and toddlers served under Part B of IDEA and of early intervention services provided to infants under Part C of IDEA. The National Early Intervention Longitudinal Study (NEILS), the Pre-Elementary Educational Longitudinal Study (PEELS), and the Special Education Elementary Longitudinal Study (SEELS) provide data on the nature and quality of related services. For example, NEILS provides data on the types of related services received during the first 6 months of service (1997-1998). Infants, toddlers, and their families received a wide range of services, including 53% who received speech or language therapy, 39% who received occupational therapy, 38% who received physical therapy, and 20% who received family training. During the 2003-2004 school year, PEELS reports that 97% of children with disabilities ages 3 through 5 attended instructional programs, including preschool or received related services that again included speech or language therapy, occupational therapy, or physical therapy. The most recent wave of SEELS data (2004) reveals that many elementary special education students received related services, including 31% who received speech or language therapy, 8% who received occupational therapy, 4% who received social work services, and 2% who received audiology services.

In the context of this limited research base, the Institute is interested in launching its special education research program on related services. This program will support both child-level and system-level research on interventions for children receiving related services under Part B or Part C of IDEA. Child-level research might develop new interventions or explore research on the relative effectiveness of related services varying in frequency and intensity to improve the acquisition, use, and generalization of skills learned in therapeutic settings. System-level research might examine variation in outcomes as a function of the service delivery models, specific program implementation, or personnel preparation.

In the following sections, we provide a range of examples of the kind of research questions that might be addressed at the child-level and systems-level for the area of speech and language services, as well as psychological services. These examples are designed to be illustrative of research questions, but are not intended to limit the potential research questions in other related service areas including speech-

language pathology and audiology services, interpreting services, physical and occupational therapy, early identification and assessment of disabilities in children, counseling services, including rehabilitation counseling, orientation and mobility services, social work services in schools, and parent counseling and training.

Child-level research in the area of speech and language services, for example, might focus on the acquisition, use, and generalization of receptive and expressive communication and language skills. Specific research questions include but are not limited to: What practices, programs, strategies or interventions are effective in improving the acquisition and use of receptive and expressive communication for children with minimal linguistic skills (e.g. gesture, sign language, cued speech, alternative communication)? What practices, programs, strategies or interventions are effective in improving the acquisition and use of language skills in academic and naturalistic settings for children with fluency, articulation, and voice disorders? What levels of intensity and frequency (i.e., “dosage”) are needed to improve the acquisition, use, and generalization of communication and language? What types of practices, programs, strategies or interventions lead to greater generalization of communication and language skills across settings (i.e., academic and naturalistic settings)? System-level research in the area of speech and language services might focus on the efficacy of service delivery models or various levels and types of personnel preparation. Specific research questions include but are not limited to: What related service delivery models (i.e., multidisciplinary, interdisciplinary, or transdisciplinary) improve the acquisition, use, and generalization of communication and language skills? Within these models, what is the effect of various types of delivery (e.g., direct, consultative, collaborative) across a range of communication and language outcomes? What practices, programs, strategies or interventions or related service delivery models improve the ability of parents and teachers to embed communication and language skills learned in therapeutic settings within the classroom and home settings? What practices, programs, strategies or interventions or related service delivery models improve the ability of teachers and parents to reinforce skills learned in therapeutic settings within classroom and home settings? What features and levels of speech and language service providers’ personnel preparation or professional development (e.g., high and continuous professional development support vs. low and incidental professional development support) are most effective in promoting the high quality implementation of evidence-based practices for children with communication and language impairments?

For psychological services in the schools, child-level research might focus on improving academic and/or behavioral outcomes of children with disabilities. Specific research questions include but are not limited to: What types of psychological services (e.g., cognitive behavioral therapy, behavioral therapy, “talk” therapy) lead to improved child outcomes? What levels of intensity and frequency (e.g., weekly, biweekly, monthly) are needed to improve behavioral and academic outcomes for children who receive psychological services? System-level research in the area of psychological services in the schools might focus on the efficacy of service delivery models or various levels and types of personnel preparation. Specific research questions include but are not limited to: What type of psychological service model is most effective within schools? For example, is there a differential effect on child outcomes for indirect (e.g., consultation with teachers) versus direct (e.g., individual or group counseling) service models? What are the roles of various mental health providers within schools (e.g., school psychologist, social worker, school-based mental health provider), and how does the specific provider of the service affect the delivery and effectiveness of practices, programs, strategies, and interventions? What practices, programs, strategies, and interventions or related service delivery models improve the ability of parents

and teachers to embed skills used in therapeutic settings within the classroom and home settings? What practices, programs, strategies or interventions or related service delivery models improve the ability of teachers and parents to reinforce skills learned in therapeutic settings within classroom and home settings? What features and levels of psychological services providers' personnel preparation or professional development (e.g., high and continuous professional development support vs. low and incidental professional development support) are most effective in promoting positive behavioral and academic outcomes?

For this program of research, the emphasis should be on improving the full range of outcomes for infants, toddlers, young children, and students who receive related services. In particular, emphasis should be placed on understanding the relationship between the provision of related services and the improvement of developmental outcomes, school readiness, or school performance.

### PART III. REQUIREMENTS OF THE PROPOSED RESEARCH

#### 5. GENERAL REQUIREMENTS OF THE PROPOSED RESEARCH

##### A. Basic Requirements

- a. *Focus on services for students with disabilities.*** This competition is restricted to special education research for students with disabilities, as previously defined (see p. 3, [Request for Applications](#)).
- b. *Resubmissions.*** Applicants who intend to revise and resubmit a proposal that was submitted to one of the Institute's FY 2007 competitions but that was not funded must indicate on the application form that their FY 2008 proposal is a revised proposal. Their FY 2007 reviews will be sent to this year's reviewers along with their proposal. Applicants should indicate the revisions that were made to the proposal on the basis of the prior reviews using no more than 3 pages of Appendix A.
- c. *Applying to multiple topics.*** Applicants may submit proposals to more than one of the Institute's FY 2008 competitions or topics. In addition, within a particular competition or topic, applicants may submit multiple proposals. However, applicants may submit a given proposal only once (i.e., applicants may not submit the same proposal or very similar proposals to multiple topics, to multiple goals in the same topic, or to multiple competitions). If the Institute determines prior to panel review that an applicant has submitted the same proposal or very similar proposals to multiple topics within or across competitions and the proposal is judged to be compliant and responsive to the submission rules and requirements described in the Request for Applications, the Institute will select one version of the application to be reviewed by the appropriate scientific review panel. If the Institute determines after panel review that an applicant has submitted the same proposal or very similar proposals to multiple topics within or across competitions and if the proposal is determined to be worthy of funding, the Institute will select the topic under which the proposal will be funded.
- d. *Applying to a particular goal within a topic.*** To submit an application to one of the Institute's education research programs, applicants must choose the specific goal under which they are applying. Each goal has specific requirements.
- e. *Inclusions and restrictions on the Special Education Research Grants Programs.*** For the FY 2008 Special Education Research Grants Programs, applicants must submit under *either* Goal One *or* Goal Two *or* Goal Three *or* Goal Four *or* Goal Five. The numbering of goals is consistent across the Institute's research programs. Each goal has specific requirements that are described in the following section.

Note: Applicants proposing to study students at risk for developing disabilities must present research-based evidence of the documented risks in their study population and the specific disabilities that may result. In addition, applicants proposing to study personnel preparation and professional development interventions around specific student-level programs or curricula must maintain a clear focus on studying the content, methods, and outcomes of the professional development and must not simply study the effectiveness of the student-level programs or curricula.

*f. Determining which goal is most appropriate for the proposed project.* Applicants should read carefully the requirements for each Goal and the examples of appropriate projects under each Goal. The Institute strongly encourages potential applicants to contact the relevant program officer listed in [Section 19](#) if they have any questions regarding the appropriateness of a particular project for submission under a specific goal.

## **B. Requirements for Goal One (Identification Projects)**

*Because the requirements for Goals One through Four are essentially the same across the Institute's competitions and topics, a generic description is used in all of the relevant funding announcements. Consequently, the examples provided may not apply to a particular competition or topic.*

*a. Purpose of identification studies.* Through all of its research programs that include the Identification goal (Goal One), the Institute is interested in the identification of existing programs and practices that may be associated with better academic outcomes and examination of factors and conditions that may mediate or moderate the relations between student outcomes and these programs and practices.

For Goal One, the Institute invites applications to conduct analyses of multivariate data, such as longitudinal individual student data that exist in a number of federal-, state-, and district-level databases. Using existing longitudinal data sets, investigators are able to capitalize on natural variation or discontinuities in education practices. For example, in a particular year, a large district might have implemented an intervention (e.g., curriculum, program, policy) at the beginning of a specific year. An investigator might propose interrupted time series analyses of the district's longitudinal datasets to examine changes in student outcomes that follow the implementation of the new intervention. As a second example, a state may have implemented a new policy for early intervention for children with disabilities that provide financial incentives for existing daycare and preschool providers to include children with disabilities within their programs. A researcher might utilize the state's administrative database on preschool programs funded through the state's pre-kindergarten initiative to determine the degree to which the new policy changed the rate of inclusion, the conditions that were correlated with the variations in the uptake of the new policy by individual preschool providers, and the performance of children with disabilities on assessments. These quantitative data might be augmented by interviews with administrators and teachers to garner impressions on barriers and challenges to implementing the new policy. The aim would be to develop a quantitative description of how the new policy is working, and hypotheses derived from both quantitative and qualitative data about how it could be made to work more effectively.

The strongest approaches to statistical modeling of multivariate data involve testing two or more models of relationships using the same data. Because multivariate analyses cannot fully adjust for selection biases and the effects of variables that were not measured or were not measured well, they are seldom if ever sufficient to support strong causal conclusions about what works. However, when two or more models of relationships among variables are tested with the same data, it may be possible to determine that one is more plausible than another, thus providing information relevant to understanding what does not work, as well as what does work. That, in turn, can direct future efforts in avenues that are more likely to be productive.

As an alternative to analyzing existing longitudinal databases, applicants may propose to conduct a small scale descriptive longitudinal study with primary data collection in which they attempt to predict student outcomes based on differences in observed education practices. For example, a researcher might propose to conduct detailed, quantifiable observational measures of instructional practices (types of instruction, frequency, duration, under what circumstances), and then use the instructional data in conjunction with child characteristics to predict subsequent student performance. The objective here is to identify what type or combinations of instructional activities are associated with better student outcomes and for which students.

Evidence obtained through a Goal One project of the association between exposure to a program, practice, or policy and better student outcomes has the possibility of being used to support a subsequent application for a Goal Two (Development) or Goal Three (Efficacy) project.

*By addressing the theoretical and empirical rationale for the study and the practical importance of the intervention (e.g., program, practice) that will be examined, Goal One applicants are addressing the significance of their proposal.*

**b. Methodological requirements. For all applications, including those submitted under Goal One, the proposed research design must be appropriate for answering the research questions or hypotheses that are posed.**

- (i) *Research questions.* Applicants should pose clear, concise hypotheses or research questions.
- (ii) *Database.* Applicants proposing secondary data analyses should describe clearly the database(s) to be used in the investigation including information on sample characteristics, variables to be used, and ability to ensure access to the database if the applicant does not already have access to it. The database should be described in sufficient detail so that reviewers will be able to judge whether or not the proposed analyses may be conducted with the database. If multiple databases will be linked to conduct analyses, applicants should provide sufficient detail for reviewers to be able to judge the feasibility of the plan. If the applicant does not currently have access to the databases needed for the study, the applicant should provide sufficient documentation (e.g., letters of agreement) to assure reviewers that access can be obtained and the project can be carried out in a timely fashion.

The applicant should describe the primary outcome measures to be used, including reliability and validity. In particular, applicants should provide sufficient information on the construct validity of the proposed measures. For example, if the applicant proposes to use a state database from which the primary outcome measure will be performance on a reading or mathematics achievement measure, the applicant should detail the standardized measure from which the reading or mathematics scores are derived.

- (iii) *Primary data collection.* Applicants may propose a Goal One project in which the primary focus is on the collection and analysis of original data. The applicant should carefully describe the sample, measures (including reliability and validity), and procedures proposed for the primary data collection. Because Goal One projects must be designed to predict student outcomes, if observational data are collected, applicants should describe how the data would be collected

(e.g., procedures for maintaining inter-observer reliability), coded, and quantified to allow quantitative analyses predicting the relation between what was observed and student outcomes.

Applicants may also propose to collect original data as a supplement to be used with an existing longitudinal database in order to answer the question of interest. In such cases, applicants should describe the sample and how the sample is related to or links to the proposed secondary database, the measures to be used (including information on the reliability and validity of the proposed instruments), and data collection procedures.

- (iv) *Data analysis.* The applicant must include detailed descriptions of data analysis procedures. Because predictor variables relevant to education outcomes (e.g., student, teacher, or district characteristics) often covary, the Institute expects investigators to utilize the most appropriate state-of-the-art analytic techniques to isolate the possible effects of variables of interest. Analytic strategies should allow investigators to examine mediators and moderators of programs and practices. The relation between hypotheses, measures, independent and dependent variables should be well specified. Strong applications will include an explicit discussion of how exclusion from testing, or missing data, will be handled within the statistical analyses. Strong applications will propose an approach for comparing hypotheses or models of relationships among variables.

**c. *Personnel and resources.*** Competitive applicants will have research teams that collectively demonstrate expertise in: (a) the relevant student outcome (e.g., reading, mathematics, student behaviors); (b) the type of intervention under investigation (e.g., curriculum, program, policy); (c) implementation of, and analysis of results from, the research design that will be employed; and (d) working with teachers, schools, or other education delivery settings that will be employed if original data will be collected. Competitive applicants will have access to institutional resources that adequately support research.

**d. *Awards.*** Typical awards for projects at this level are \$100,000 to \$350,000 (total cost = direct + indirect costs) per year. For applicants proposing to do primarily secondary data analysis, the maximum duration of the award is 2 years. Applicants proposing to do short-term longitudinal studies may request up to 2 additional years (i.e., the maximum duration of the award is 4 years) and additional funds, but must justify the need for the additional time and funding. The size of the award depends on the scope of the project.

### **C. Requirements for Goal Two (Development Projects)**

**a. *Purpose of Goal Two (Development).*** Through all of its research programs that include the Development goal (Goal Two), the Institute intends to support the development of education interventions – curricula, instructional approaches and programs. The Institute stresses that Goal Two applications are about development, rather than demonstrations of the efficacy of an intervention. Under Goal Two, the Institute does not intend to support applications that propose to allocate substantial resources for testing the effect of the proposed intervention. For example, the Institute does not intend to support under Goal Two applications in which the researcher proposes to spend one year developing the intervention and the second and third years on testing the effect of the intervention in a significant

number of classrooms or schools. Applicants who have an intervention that could be tested for efficacy should apply to Goal Three.

From the Institute's standpoint, a funded development project would be successful if at the end of a 1- to 3-year development award, the investigators had a fully developed version of the proposed intervention, including prototypes of all materials and products necessary for implementation of the intervention in authentic education delivery settings, and evidence demonstrating the feasibility of its implementation in an authentic education delivery setting. The Institute anticipates that investigators with successful development projects would submit proposals to subsequent competitions for Goal Three (Efficacy) awards.

**b. *Requirements for proposed intervention.*** Under Goal Two, the Institute invites applications to develop new interventions or further develop interventions that are in the early stages of development (e.g., those that do not have an entire program or product ready to evaluate). It is important for applicants to provide a strong rationale to support the development of the proposed intervention. In essence, applicants are answering the question: *Why is the proposed intervention likely to produce better student outcomes relative to current education practices?*

In strong applications, researchers provide context for the proposed intervention by including data on, or reviewing research describing, the attributes of typical existing practices. Understanding the shortcomings of current practice contributes to the rationale for the proposed intervention.

Applicants should clearly describe the intervention and the logic model for the intervention. For example, how do the features or components of the intervention relate to each other temporally (or operationally), pedagogically, and theoretically (e.g., why does A lead to B)? Applicants should provide a strong theoretical and empirical justification for the design and sequencing of the features or components of the intervention. When applicants clearly describe the logic model that guides the intervention and the specific features making up the intervention, reviewers are better able to evaluate (a) the relation between the theoretical and empirical foundation for the intervention and the intervention (e.g., is the proposed intervention a reasonable operationalization of the theory?) and (b) the relation between the intervention and the outcome measures (e.g., do the proposed measures tap the constructs that the intervention is intended to address?).

Applicants should explain why the proposed intervention is likely to produce substantially better student outcomes relative to current practice. By clearly describing the intervention – particularly, the unique features of the intervention ("active ingredients") that are hypothesized to produce the desired improvement in student outcomes – as well as the typical existing practices, reviewers are better able to judge whether the proposed intervention has the potential to produce substantially better student outcomes because it is sufficiently different from current practices and has "active ingredients" that appear on the basis of theoretical or empirical reasons to be powerful agents for improving student learning.

In the rationale to support the proposed intervention, applicants should address the *practical* importance of the proposed intervention. For example, when the proposed intervention is fully developed, will it have the potential to improve students' achievement scores in educationally meaningful increments, if it were implemented over the course of a semester or school year? In addition, would the proposed

intervention be both affordable for schools and easily implemented by schools (e.g., not involve major adjustments to normal school schedules)?

*By describing (a) the intervention (e.g., features, components) and the logic model for the intervention, (b) the theoretical and empirical support for the proposed intervention, and (c) the practical importance of the intervention, Goal Two applicants are addressing aspects of the significance of their proposal.*

**c. Methodological requirements. For all applications, including those submitted under Goal Two, the proposed research design must be appropriate for answering the research questions or hypotheses that are posed.**

For Goal Two projects, applicants must clearly address the proposed methods for developing the intervention and testing the feasibility of implementation of the prototype in an authentic education delivery setting. Applicants should describe the systematic process they will use to collect empirical data that will provide feedback for refining the intervention. A major objective of Goal Two projects is to refine and improve the initial version of the intervention by implementing it, or components of it, observing its functioning, and making necessary adjustments in the design of the intervention so that it functions more as intended.

Strong applications include clear descriptions of the development activities so that reviewers will understand (a) what will be developed, (b) how it will be developed, and (c) when the development will take place. Applicants should describe what they would measure or observe to determine whether the intervention is working as intended when they are testing the feasibility of successive versions of the intervention. A useful by-product of such testing is a set of fidelity of intervention measures that could be used if the intervention were evaluated in an efficacy trial (see Goal Three).

A timeline that delineates the iterative process of drafting and revising the intervention (e.g., features or components of the intervention, procedures, training activities, and materials) is often a simple way of showing reviewers how research activities will feed into subsequent development (refinement) activities, so that information can be used to make decisions and improvements. A variety of methodological strategies may be employed during this phase. *For Development projects, reviewers need to understand the iterative development process to be used in the design and refinement of the proposed intervention.*

By the end of a Goal Two project, the Institute expects investigators to have a fully developed intervention and demonstrated that the intervention can be implemented in an authentic education delivery setting.

- (i) *Sample.* The applicant should define, as completely as possible, the samples and settings that will be used to assess the feasibility and usability of the intervention.
- (ii) *Research plan.* The applicant must provide a detailed research plan in which they detail the proposed procedures for developing the intervention. Strong applications will include clear descriptions of: (a) what needs to be developed; (b) the procedures for developing the intervention; and (c) the procedures (including sample, measures, and procedures for analyzing data) for determining if the intervention is functioning as intended (e.g., Does the software program crash when students use it? Are the activities planned for a particular lesson do-able

within the allotted time?). *Applicants should describe the iterative development process to be used in the design and refinement of the proposed intervention, and plans for acquiring evidence about the operation of the intervention according to the logic model that they describe.*

- (iii) *Measures.* Goal Two projects typically rely on the collection of process data that can help the researcher refine the intervention and provide insight into the feasibility and usability of the proposed intervention in authentic education delivery settings. Applicants should clearly describe (a) what needs to be observed in order to determine if the intervention is operating as intended and (b) how those observations will be collected. Observational, survey, or qualitative methodologies are encouraged to identify conditions that hinder implementation of the intervention.

**d. *Personnel and resources.*** Competitive applicants will have research teams that collectively demonstrate expertise in: (a) the relevant content area (e.g., reading, mathematics, student behaviors); (b) type of intervention to be developed; (c) implementation of, and analysis of results from, the research design that will be employed; and (d) working with schools and other education delivery settings. Competitive applicants will have access to institutional resources that adequately support research.

An applicant may be or may involve *for-profit entities* in the project. Involvement of the commercial developer or distributor must not jeopardize the objectivity of the research. *Collaborations including for-profit developers or distributors of education products must justify the need for Federal assistance to undertake the evaluation of programs that are marketed to consumers and consider cost-sharing part of the cost of the evaluation.*

Applicants who previously or currently hold development grants with the Institute should describe the results and outcomes of those grants to date. They should indicate whether what was developed has been (or is being) evaluated for efficacy (Goal Three) and if results are available, what the results of those efficacy evaluations have been. The Institute intends to support researchers under Goal Two who can demonstrate their ability to develop interventions that can be used in the field and tested for efficacy.

**e. *Awards.*** Typical awards for projects at this level are \$150,000 to \$500,000 (total cost = direct + indirect costs) per year. Development projects are for a maximum of 3 years. Development costs vary according to the type of intervention that is proposed. Larger awards will be considered. In all cases, the size of the award depends on the scope of the project.

#### **D. Requirements for Goal Three (Efficacy and Replication Trials)**

*Because the requirements for Goal Three are essentially the same across the Institute's research grant topics, a generic description is used in the funding announcement. Consequently, the examples provided may not apply to a particular topic.*

Under Goal Three, the Institute requests proposals to test the efficacy of fully developed interventions. By *efficacy*, the Institute means the degree to which an intervention has a net positive impact on the outcomes of interest in relation to the program or practice to which it is being compared.

**a. *Purpose of efficacy and replication trials.*** Through all of its research programs that include the Efficacy and Replication goal (Goal Three), the Institute intends to fund efficacy trials to determine

whether or not fully-developed interventions – programs, practices – are effective under specified conditions (e.g., urban schools with a high turnover rate among teachers), and with specific types of students (e.g., English language learners). Results from efficacy projects have less generalizability than results from effectiveness (scale-up) evaluations under Goal Four. The limited generalizability can arise both from the lack of a full range of types of settings and participants in the study, as well as through the intensive involvement of the developers and researchers in the implementation of the intervention. A well-designed efficacy trial provides evidence on whether an intervention **can** work, but not whether it would work if deployed widely. Under Goal Three, applicants may propose an efficacy trial to determine if an intervention will work under specific conditions or a replication trial to determine if an intervention shown to produce a net positive impact in one setting will produce a net positive impact under different conditions (e.g., with a different population of students).

Under Goal Three, an applicant might propose to examine the efficacy of the intervention in an experimental study in which, for example, half of the classrooms are randomly assigned to the intervention program and half are assigned to continue using standard district practices. Alternatively, if the research team hypothesized that a variation in the delivery of the program might improve the impact of the intervention, the team might propose instead to randomly assign: (a) one-third of the classrooms to the basic intervention; (b) one third of the classrooms to the variation; and (c) one-third of the classrooms to continue with standard district practices. *Applicants should use the efficacy and replication trials to determine the conditions, if any, under which an intervention produces meaningful improvement on academic outcomes.*

Also of interest to the Institute are proposals to compare the impact of two interventions that are based on different theoretical models. In such cases, the purpose might be to compare the efficacy of two well-developed approaches to improving student learning. One advantage to this approach is that, relative to designs in which the comparison group experiences whatever the school or district currently provides (but see the discussion of "business-as-usual" treatments below), the investigator should have better knowledge of the critical components of each intervention and can attempt to create two conditions in which, for example, instruction varies on a number of critical components.

From the Institute's standpoint, a funded Efficacy/Replication project would be *methodologically successful* if at the end of the grant period, the investigators had rigorously evaluated the impact of a clearly specified intervention on relevant student outcomes and under clearly described conditions using a research design that meets the Institute's What Works Clearinghouse standards (<http://whatworks.ed.gov>), whether or not the intervention is found to improve student outcomes relative to the comparison condition. The Institute would consider methodologically successful projects to be *pragmatically successful* if the rigorous evaluation determined that the intervention has a net positive impact on student outcomes in relation to the program or practice to which it is being compared.

The Institute recognizes that research on children with disabilities often utilizes alternative research designs for determining the causal impact of an intervention due to small populations of children with specific disabilities. In such cases, rigorous single subject designs are appropriate. Requirements for single subject designs are detailed in sub-section [5.D.d. Requirements for single subject designs](#).

**b. Requirements for the proposed intervention.** Interventions appropriate for study under Goal Three are interventions that are fully developed and have evidence of their feasibility for use in authentic education delivery settings.

- (i) Applicants must have an intervention that is fully developed and ready to be evaluated. Applicants who intend to devote a significant part of the project period to developing new components or materials for the intervention or new delivery approaches should apply to Goal Two. Goal Three projects are limited to those interventions that are fully developed.

Applicants must provide evidence that the intervention can be implemented in authentic education delivery settings – that is, evidence of the feasibility and usability of the proposed intervention in authentic education delivery settings. The interventions may already be in wide use in education setting or may be newly (but fully) developed interventions.

Also appropriate for Goal Three applications are proposals to *replicate* the efficacy of an intervention in a different setting. For instance, in a previous study, the applicant could have demonstrated the efficacy of an intervention in a small random assignment trial in an urban school district, and a reasonable next step would be to *replicate* these findings in a rural school district.

- (ii) Applicants must provide a compelling rationale that justifies the Institute's investment in the evaluation of the proposed intervention. As justification for the evaluation of an intervention, the Institute will accept conceptual arguments of the importance of evaluating the proposed intervention because of its relevance to public policy or current education practice as would be judged by practitioners and policymakers. For example, the proposed intervention may already be widely used but have not been rigorously evaluated (e.g., a commercially distributed program, a specific education policy). To support this argument, applicants might include documentation of the widespread use (e.g., across multiple states, or a single large state) of the program to justify the proposed efficacy evaluation.

Alternatively, applicants could provide a strong rationale justifying the investment in the evaluation of the proposed intervention based on (a) the theoretical foundation on which the intervention was developed; (b) research on related interventions or components of the proposed interventions; and/or (c) empirical evidence of the effect or potential effect of the proposed intervention based on smaller scale studies. In such cases, the applicant needs to address the question: Why is this intervention likely to produce better student outcomes relative to current practice? In addition, such applicants should address the *practical* importance of the proposed intervention. For example, is the intervention sufficiently comprehensive to improve student outcomes on end-of-year assessments? Is there evidence indicating that the proposed intervention is sufficiently different from current practices to potentially improve student outcomes relative to current practices?

- (iv) Applicants should clearly describe a logic model for the proposed intervention (e.g., describing the features or components of the intervention and how they relate to each other and to the intended outcomes both temporally (or operationally) and theoretically (e.g., why A leads to B)). When applicants clearly describe the model that guides the intervention and the intervention

itself (e.g., specific features or components of the intervention), reviewers are better able to evaluate the relation between the theoretical and empirical foundation for the intervention and the intervention (e.g., is the proposed intervention a reasonable operationalization of the theory?). Reviewers are also better able to evaluate the relation between the intervention and the outcome measures (e.g., do the proposed measures tap the constructs that the intervention is intended to address?).

Some interventions are designed to affect the teaching and learning environment and indirectly affect student outcomes. In such cases, it is important for applicants to be clear in their logic model of the mediators that the intervention is designed to affect and through which student outcomes are intended to be improved.

Strong applications will also include detailed descriptions of what the comparison group experiences. By clearly describing the intervention and the comparable treatment that the comparison group will receive, reviewers are better able to judge whether: (a) the intervention is sufficiently different from the comparison treatment so that one might reasonably expect a difference in student outcomes, and (b) fidelity measures and observations of the comparison group are sufficiently comprehensive and sensitive to identify and document critical differences between what the intervention and comparison groups receive.

*By describing (a) the intervention (e.g., features, components) and the logic model for the intervention, (b) the theoretical and empirical support for the proposed intervention, and (c) the practical importance of the intervention, Goal Three applicants are addressing aspects of the significance of their proposal.*

**c. Methodological requirements. Under Goal Three, the proposed research design must be appropriate for answering the research questions or hypotheses that are posed.**

- (i) *Research questions.* Applicants should pose clear, concise hypotheses or research questions.
- (ii) *Sample.* The applicant should define, as completely as possible, the sample to be selected and sampling procedures to be employed for the proposed study, including justification for exclusion and inclusion criteria. Additionally, the applicant should describe strategies to increase the likelihood that participants will remain in the study over the course of the evaluation (i.e., reduce attrition).
- (iii) *Research design.* The applicant must provide a detailed research design. Applicants should describe how potential threats to internal and external validity would be addressed. Studies using randomized assignment to treatment and comparison conditions are strongly preferred. When a randomized trial is used, the applicant should clearly state the unit of randomization (e.g., students, classroom, teacher, or school); choice of randomizing unit or units should be grounded in a theoretical framework. Applicants should explain the procedures for assignment of groups (e.g., schools) or participants to treatment and comparison conditions.<sup>1</sup>

---

<sup>1</sup> For additional information on describing procedures for randomization, see the What Works Clearinghouse document, *Evidence Standards for Reviewing Studies* (p. 6), available at [http://www.whatworks.ed.gov/reviewprocess/study\\_standards\\_final.pdf](http://www.whatworks.ed.gov/reviewprocess/study_standards_final.pdf).

*Only in circumstances in which a randomized trial is not possible* may alternatives that substantially minimize selection bias or allow it to be modeled be employed. Applicants proposing to use a design other than a randomized design must make a compelling case that randomization is not possible. Acceptable alternatives include appropriately structured regression-discontinuity designs or other well-designed quasi-experimental designs that come close to true experiments in minimizing the effects of selection bias on estimates of effect size. A well-designed quasi-experiment is one that reduces substantially the potential influence of selection bias on membership in the intervention or comparison group. This involves demonstrating equivalence between the intervention and comparison groups at program entry on the variables that are to be measured as program outcomes (e.g., student achievement scores), or obtaining such equivalence through statistical procedures such as propensity score balancing or regression. It also involves demonstrating equivalence or removing statistically the effects of other variables on which the groups may differ and that may affect intended outcomes of the program being evaluated (e.g., demographic variables, experience and level of training of teachers, motivation of students). Finally, it involves a design for the initial selection of the intervention and comparison groups that minimizes selection bias or allows it to be modeled. For example, a very weak quasi-experimental design that would *not* be acceptable as evidence of program efficacy would populate the intervention condition with teachers who volunteered for the program to be evaluated, and would select comparison teachers who had the opportunity to volunteer but did not. In contrast, an acceptable design would select teachers in one particular geographical area of a city to be in the intervention, whereas teachers in another geographical area, known to be demographically similar, would be selected to be in the comparison condition. In the former case, self-selection into the intervention is very likely to reflect motivation and other factors that will affect outcomes of interest and that will be impossible to equate across the two groups. In the latter case, the geographical differences between the participants in the two groups would ideally be unrelated to outcomes of interest, and in any case, could be measured and controlled for statistically.

For instances in which small populations of children with specific disabilities restricts the possibilities for conducting group evaluations, rigorous single subject designs are appropriate for demonstrating the efficacy of an intervention. See [5.D.d. Requirements for single subject designs](#) for details.

- (iv) *Power.* Applicants should clearly address the power of the evaluation design to detect a reasonably expected and minimally important effect. When applicants justify what constitutes a reasonably expected effect, applicants should indicate clearly (e.g., including the statistical formula) how the effect size was calculated.

Many evaluations of education interventions are designed so that clusters or groups of students, rather than individual students, are randomly assigned to treatment and comparison conditions. In such cases, the power of the design depends in part on the degree to which the observations of individuals within groups are correlated with each other on the outcomes of interest. For determining the sample size, applicants need to consider the number of clusters, the number of individuals within clusters, the potential adjustment from covariates, the desired effect, the intraclass correlation (i.e., the variance between clusters relative to the total variance between

and within clusters), and the desired power of the design (note, other factors may also affect the determination of sample size, such as using one-tailed vs. two-tailed tests, repeated observations, attrition of participants, etc.).<sup>2</sup> Strong applications will include empirical justification for the intraclass correlation and anticipated effect size used in the power analysis.

- (v) *Measures.* Measures of student outcomes should include relevant standardized measures of student achievement in addition to other measures of student learning and achievement that are more closely aligned with the proposed intervention (e.g., researcher-developed measures). The applicant should provide information on the reliability, validity, and appropriateness of proposed measures. In strong applications, investigators will make clear that the skills or content the intervention is designed to address are captured in the various measures that are proposed.

Some interventions are designed to change directly the teaching and learning environment and indirectly affect student outcomes. In such cases, applicants should provide measures of the primary mediators (i.e., proximal outcomes), as well as measures of student outcomes.

- (vi) *Fidelity of implementation of the intervention.* The applicant should specify how the implementation of the intervention would be documented and measured. In strong applications, investigators will make clear how the fidelity measures capture the critical features of the intervention. Investigators should propose research designs that permit the identification and assessment of factors impacting the fidelity of implementation.
- (vii) *Comparison group, where applicable.* Comparisons of interventions against other conditions are only meaningful to the extent that one can tell what comparison group receives or experiences. Applicants should compare intervention and comparison groups on the implementation of critical features of the intervention so that, for example, if there is no observed difference between intervention and comparison student outcomes, they can determine if key elements of the intervention were also provided in the comparison condition (i.e., a lack of distinction between the intervention treatment and the comparison treatment).

In evaluations of education interventions, individuals in the comparison group typically receive some kind of treatment; rarely is the comparison group a "no-treatment" control. For some evaluations, the primary question is whether the treatment is more effective than a particular alternative treatment. In such instances, the comparison group receives a well-defined treatment that is usually an important comparison to the target intervention for theoretical or pragmatic reasons. In other cases, the primary question is whether the treatment is more effective than what is generally available and utilized in schools. In such cases, the comparison group might receive what is sometimes called "business-as-usual." That is, the comparison group receives whatever the school or district is currently using or doing in a particular area. Business-as-usual generally refers to situations in which the standard or frequent practice across the nation is a relatively undefined education treatment. However, business-as-usual may also refer to

---

<sup>2</sup> For more information, see Donner, A., & Klar, N. (2000). *Design and Analysis of Cluster Randomization Trials in Health Research*. New York: Oxford University Press; Murray, D. M. (1998). *Design and Analysis of Group-Randomized Trials*. New York: Oxford University Press; W.T. Grant Foundation & University of Michigan, [http://sitemaker.umich.edu/group-based/optimal\\_design\\_software](http://sitemaker.umich.edu/group-based/optimal_design_software).

situations in which a branded intervention (e.g., a published curriculum or program) is implemented with no more support from the developers of the program than would be available under normal conditions. In either case, *using a business-as-usual comparison group is acceptable*. When business-as-usual is one or another branded intervention, applicants should specify the treatment or treatments received in the comparison group. In all cases, applicants should account for the ways in which what happens in the comparison group are important to understanding the net impact of the experimental treatment. As noted in the preceding paragraph, in strong applications, investigators propose strategies and measures for comparing the intervention and comparison groups on key features of the intervention.

The purpose here is to obtain information useful for *post hoc* explanations of why the experimental treatment does or does not improve student learning relative to the counterfactual.

Finally, the applicant should describe strategies they intend to use to avoid contamination between treatment and comparison groups. Applicants do not necessarily need to randomize at the school level to avoid contamination between groups. Applicants should explain and justify their strategies for reducing contamination.

- (viii) *Mediating and moderating variables*. Observational, survey, or qualitative methodologies are encouraged as a complement to experimental methodologies to assist in the identification of factors that may explain the effectiveness or ineffectiveness of the intervention. Mediating and moderating variables that are measured in the intervention condition that are also likely to affect outcomes in the comparison condition should be measured in the comparison condition (e.g., student time-on-task, teacher experience/time in position).

The evaluation should be designed to account for sources of variation in outcomes across settings (i.e., to account for what might otherwise be part of the error variance). Applicants should provide a theoretical rationale to justify the inclusion (or exclusion) of factors/variables in the design of the evaluation that have been found to affect the success of education programs (e.g., teacher experience, fidelity of implementation, characteristics of the student population). The research should demonstrate the conditions and critical variables that affect the success of a given intervention. The most scalable interventions are those that can produce the desired effects across a range of education contexts.

- (ix) *Data analysis*. All proposals must include detailed descriptions of data analysis procedures. For quantitative data, specific statistical procedures should be described. The relation between hypotheses, measures, independent and dependent variables should be clear. For qualitative data, the specific methods used to index, summarize, and interpret data should be delineated.

Most evaluations of education interventions involve clustering of students in classes and schools and require the effects of such clustering to be accounted for in the analyses, even when individuals are randomly assigned to condition. Such circumstances generally require specialized multilevel statistical analyses using computer programs designed for such purposes. Strong applications will provide sufficient detail for reviewers to judge the appropriateness of the data analysis strategy. For random assignment studies, applicants need to be aware that typically the primary unit of analysis is the unit of random assignment.

- d. Requirements for single subject designs.** By single-subject designs, the Institute refers to experimental studies using reversal or multiple baseline or interrupted time series designs intended to demonstrate a causal relationship between two variables using a small number of participants or cases. We are not referring to descriptive case studies.
- (i) *Sample.* Applicants must define the criteria used for selecting participants, the process for selecting participants, and the critical features of the physical setting from which participants are recruited with sufficient detail to allow other researchers to identify similar individuals from similar settings. Defining selection criteria typically requires specifying a particular disability, the measurement instrument, and criterion used to identify the disability.
  - (ii) *Intervention.* In addition to meeting the requirements for interventions listed above in subsection [5.D.b. Requirements for proposed intervention](#), applicants must describe the intervention in sufficient detail to allow other researchers to reliably replicate the intervention. Applicants must clearly specify how, when, and under what conditions the intervention will be implemented to demonstrate how the intervention was systematically manipulated and under the control of the researcher.
  - (iii) *Fidelity of implementation.* Applicants must describe how fidelity of intervention implementation will be measured, the frequency of assessments, and what degree of variation in treatment fidelity will be accepted over the course of the study.
  - (iv) *Baseline and Comparison conditions.* The majority of single-subject research studies are likely to compare the effects of an intervention with performance during the baseline or comparison condition. Applicants must describe the baseline or comparison conditions in sufficient detail to document what can be characterized as a stable pattern of behavior and to allow other researchers to replicate the baseline condition.
  - (v) *Measures.* Applicants must identify and operationally describe the dependent variables (DVs) and outcome measures, provide technical information on the reliability and validity of the measures, detail procedures for collecting observations, and where applicable, specify procedures for determining inter-observer reliability or agreement (e.g., Kappa) associated with each DV and monitoring inter-observer reliability during the study and over both baseline and treatment conditions.
  - (vi) *Design and analysis.* Applicants must provide a detailed research design and describe how the research design demonstrates experimental control and addresses common threats to internal and external validity. Applicants should consider the anticipated size of the intervention effect, variability in response to treatment within participants across time, variability in response to treatment between subjects, and the number of replications. In essence, what criteria will the applicant use to demonstrate a functional relationship between manipulation of the intervention and the change in the outcomes, and to determine if the response to the treatment is large enough and sufficiently replicated to support a causal conclusion. Furthermore, applicants must address how intervention effects would be generalizable. Applicants are expected to describe what

statistical procedures (e.g., time series analyses), if any, will be employed to determine if the change is significant.

**d. *Personnel and resources.*** Competitive applicants will have research teams that collectively demonstrate expertise in: (a) the relevant content area (e.g., reading, mathematics, student behaviors); (b) the type of intervention being evaluated (e.g., curriculum, teacher professional development, policy); (c) implementation of, and analysis of results from, the research design that will be employed; and (d) working with schools and other education delivery settings. Competitive applicants will have access to institutional resources that adequately support research.

For Goal Three projects, an applicant may be or may involve developers or distributors (*including for-profit entities*) in the project, from having them as full partners in its proposal to using off-the-shelf training materials without involvement of the developer or distributor. Involvement of the developer or distributor must not jeopardize the objectivity of the evaluation. *Collaborations including for-profit distributors of curriculum materials should justify the need for Federal assistance to undertake the evaluation of programs that are marketed to consumers and consider sharing the cost of the evaluation.*

Competitive applicants will have access to institutional resources that adequately support research activities and access to schools in which to conduct the research. Strong applications will document the availability and cooperation of the schools or other education delivery settings that will be required to carry out the research proposed in the application via a letter of support from the education organization.

**e. *Awards.*** Typical awards for projects at this level will be \$250,000 to \$750,000 (total cost = direct + indirect costs) per year for a maximum of 4 years. Larger budgets will be considered if a compelling case can be made for such support. The size of the award depends on the scope of the project.

## **E. Requirements for Goal Four (Scale-Up Evaluations)**

**a. *Purpose of scale-up evaluations.*** Through all of its research programs that include the Scale-up Evaluations goal (Goal Four), the Institute intends to support effectiveness evaluations of interventions - programs, practices - to determine whether or not fully developed interventions are effective when they are implemented under conditions that would be typical if a school district or other education delivery setting were to implement them (i.e., without special support from the developer or the research team) across a variety of conditions (e.g., different student populations, different types of schools). The key differences between Scale-up Evaluations (Goal Four) and Efficacy Evaluations (Goal Three), as the Institute uses these terms, have to do with the delivery of the intervention and the diversity of the sample. Scale-up Evaluations require that intervention be implemented at a distance from the researcher/developer of the intervention. That is, the researchers must not be heavily involved in making the intervention work. The intervention must be implemented in the school or other authentic education setting, as it would be if the school, or entity, had purchased and implemented the intervention on its own without any involvement in a research study. Second, Scale-up Evaluations require sufficient diversity in the sample of schools, classrooms, or students to ensure appropriate generalizability. Scale-up Evaluations typically require a larger sample than an Efficacy Evaluation. For Scale-up Evaluations, the primary question of interest is, "Does this intervention produce a net positive increase in student learning and achievement relative to the control group?" As is true for Goal Three studies, for Goal Four studies, depending on the research question of interest, the control group may receive a well-

defined alternative treatment, or may receive whatever programs and practices are already currently available and utilized by schools (business-as-usual control group). Finally, the Institute invests in Scale-up Evaluations for interventions that have strong prior evidence of the efficacy of the intervention.

**b. Requirements for proposed intervention.** To be considered for Goal Four awards, applicants must provide a clear rationale for the *practical* importance of the intervention. Applicants should address three questions related to practical importance. (i) Is the intervention likely to produce educationally meaningful effects on outcomes that are important to educational achievement (e.g., grades, achievement test scores) and, therefore, are of interest to parents, teachers, and education decision makers? (ii) Is the intervention reasonably affordable to schools and other education delivery entities? (iii) Is the intervention designed so that it is feasible for schools and other education delivery entities to implement the intervention? In addition, applicants should clearly describe the components of the intervention. Interventions appropriate for study under Goal Four are interventions that are fully developed and have strong evidence of the efficacy of the program on a limited scale.

- (i) *Educationally meaningful effects.* Applicants must provide *strong* evidence of the efficacy of the program as implemented on a small scale to justify the proposal to conduct a large-scale evaluation of the effectiveness of the intervention. As an example of strong evidence of efficacy, an applicant might describe the results of two or more small scale, rigorously conducted evaluations using random assignment to intervention and comparison conditions in which the efficacy of the intervention is demonstrated with different populations (e.g., urban and rural school districts). Alternatively, a single efficacy evaluation might have involved schools from more than one district and included a diverse population of teachers and students and alone could constitute sufficient evidence of the efficacy of the intervention. Importantly, the evidence of efficacy must be based on the results of randomized field trials, or well-designed quasi-experimental evaluations.

Evidence for efficacy from single-subject experimental designs would involve multiple studies in different settings that demonstrate causal effects.

Strong applications will include information on the size and statistical significance of the effects that were obtained through efficacy trials. Effect sizes and confidence limits should typically be calculated based on a unit of analysis that is the same as the unit of random assignment. For example, the results of an efficacy trial in which classrooms were assigned to conditions should be analyzed based on classroom means rather than results from individual students. Applicants should indicate clearly (e.g., including the statistical formula) how the effect size was calculated when they use effect sizes as part of the rationale for justifying their intervention. Furthermore, information on effect sizes is more useful to reviewers when sufficient context for interpreting the effect sizes is provided.

- (ii) *Feasible implementation.* The materials, training procedures, organizational arrangements, and all other aspects of the intervention must be developed to the point where the intervention is ready to be implemented under real-world circumstances in a real-world way. Strong applications will provide reviewers with sufficient information to evaluate whether implementation of the intervention is feasible for schools and other education entities under

normal conditions (i.e., without any support from the researchers or developers of the intervention that would not typically be available to entities wanting to implement the intervention outside of a research study). For example, applicants might include results from prior efficacy trials indicating the degree of support provided for the implementation of the intervention and the level of fidelity attained across classrooms or schools.

- (iii) *Description of the intervention.* All applicants should clearly describe the intervention (e.g., features, components). When applicants clearly describe the intervention, reviewers are better able to evaluate the relation between the intervention and the outcome measures (e.g., do the proposed measures tap the constructs that the intervention is intended to address?). Strong applications will also include detailed descriptions of what the comparison group experiences. By clearly describing the components of the intervention and the comparable treatment (e.g., training program) that the comparison group will receive, reviewers are better able to judge whether (a) the intervention is sufficiently different from the comparison treatment so that one might reasonably expect a difference in student outcomes, and (b) fidelity measures and observations of the comparison group are sufficiently comprehensive and sensitive to identify and document critical differences between the intervention and comparison conditions.

**c. *Implementation of the intervention.*** One goal of scale-up evaluations of interventions is to determine if programs are effective when the developers of the program do not provide any more support than would be available under normal conditions. That is, the program should be implemented as it would be if the schools or other entities that are delivering the program were to obtain the program on their own and decide to use it apart from participation in any research and evaluation study. A second goal is to determine if programs implemented under these conditions are effective in a variety of settings. Interventions that are effective at scale are those that can produce the desired effects across a range of education contexts. For Goal Four, the applicant should detail the conditions under which the intervention will be implemented – including explicitly detailing what involvement the researcher/developer will have in the implementation of the intervention and justifying this level of involvement – and provide procedures that will capture the conditions and critical variables that affect the success of a given intervention.

*By addressing the implementation of the intervention and the requirements for the intervention, Goal Four applicants are addressing the significance of their proposal.*

**d. *Methodological requirements.*** Under Goal Four, the proposed research design must be **appropriate for answering the research questions or hypotheses that are posed.** For the methodological requirements for Goal Four projects, please refer to the [methodological requirements](#) listed under Goal Three.

In addition, to the methodological requirements listed under Goal Three, for Goal Four projects, strong applications will include a Cost-Feasibility analysis to assess the financial costs of program implementation and assist schools in understanding whether implementation of the program is practicable given their available resources. Data should be collected on the monetary expenditures for the resources that are required to implement the program. Financial costs for personnel, facilities, equipment, materials, and other relevant inputs should be included. Annual costs should be assessed to adequately reflect expenditures across the lifespan of the program. The Institute is *not* asking applicants

to conduct an economic evaluation of the program (e.g., cost-benefit, cost-utility, or cost-effectiveness analyses), although applicants may propose such evaluation activities if desired.<sup>3</sup>

**e. *Personnel and resources.*** Competitive applicants will have research teams that collectively demonstrate expertise in: (a) the relevant content area (e.g., reading, mathematics, student behaviors); (b) the type of intervention proposed (e.g., program, practice, policy); (c) implementation of, and analysis of results from, the research design that will be employed; and (d) working with schools and other education delivery settings.

Competitive applicants will have access to institutional resources that adequately support research activities and access to schools in which to conduct the research. Strong applications will document the availability and cooperation of the schools or other education delivery settings that will be required to carry out the research proposed in the application via a letter of support from the education organization.

An applicant may involve developers or distributors (*including for-profit entities*) of the intervention in the project, from having the developers as full partners in its proposal to using off-the-shelf teacher training materials without involvement of the developer or publisher. However, involvement of the developer or distributor must not jeopardize the objectivity of the evaluation. Strong applications will carefully describe the role, if any, of the developer/distributor in the intervention. Developers may not provide any training or support for the implementation that is not normally available to users of the intervention. Applicants should describe how objectivity in the evaluation would be maintained. Strong applications will assign responsibility for random assignment to condition and data analyses to individuals who are *not* part of the organization that developed or distributes the intervention.

*Collaborations including for-profit distributors of materials should justify the need for Federal assistance to undertake the evaluation of programs that are marketed to consumers and consider sharing the cost of the evaluation.*

**f. *Awards.*** The scope of Goal Four projects may vary. A smaller project might involve several schools within a large urban school district in which student populations vary in terms of SES, race, and ethnicity. A larger project might involve large numbers of students in several school districts in different geographical areas.

Awards for Goal Four projects may go up to a limit of \$6,000,000 (total cost = direct + indirect costs) over a 5-year period. Typical awards are less. Awards depend in part on the number of sites, cost of data collection, and cost of implementation. The size of the award depends on the scope of the project.

## **F. Requirements for Goal Five (Measurement)**

Across the Institute's research programs, the Measurement goals differ in purpose. Requirements described below apply to topics in the Special Education Research Grants Program.

---

<sup>3</sup> For additional information on how to calculate the costs of a program or conduct an economic evaluation, applicants might refer to Levin, H.M., & McEwan, P.J. (2001). *Cost-Effectiveness Analysis*. 2nd Ed. Thousand Oaks, CA: Sage Publications.

**a. Purpose of measurement proposals.** Through Goal Five, the Institute intends to support the development of assessment tools for four purposes including screening, diagnosis, progress monitoring, and outcome evaluation.

Screening involves brief assessments conducted with all children at the beginning of the school year and targets skills that are strongly predictive of important future outcomes. The goal of screening is to identify children who are at risk of failure and likely to need additional or alternative forms of instruction either to supplement or supplant conventional instruction.

Diagnosis refers to more in-depth assessment of strengths and weaknesses in a particular domain, and should not be confused with assessment for the purpose of labeling children with disabilities. The goal of diagnostic assessment is to provide teachers with a profile of skills and deficits to guide instruction.

Progress monitoring is assessment of students' performance on critical criterion performance skills a minimum of three times a year but typically more frequently (e.g., weekly, monthly, or quarterly) using alternate forms of a test. The purpose of progress monitoring is to estimate rates of improvement, to identify children who are not demonstrating adequate progress and, therefore, require supplementary instruction. Progress monitoring assessment provides information on a student's performance on an ongoing basis (e.g., weekly data on whether students are benefiting from a particular type of instruction). This information can be used to compare different types of instruction for a particular child on a frequent basis. Such monitoring provides a means for designing or redesigning instructional programs to accommodate the instructional needs of students with disabilities.

Outcome assessment is designed to determine if students have achieved or not achieved grade-level performance or if their performance has improved or not improved.

While each purpose of assessment is important in determining children's performance across domains and permits practitioners to gauge how students are performing at different points in time (e.g., monitoring progress during instruction vs. determining grade level proficiency) aligned with different goals, conceptualizing and conducting assessment in the broad context of accountability requires that researchers address a different set of issues and goals. Thus, the Institute is also interested in applications that address assessment for accountability.

**Assessment for Accountability.** Under Goal Five, projects may study how assessments for large-scale accountability purposes, such as meeting the requirements of NCLB, can best be designed and used to capture and represent proficiency and growth for children with disabilities. Projects must respond to the requirements of the topics under which they are applying. For example, Goal Five projects in the Mathematics and Science Education program may study assessments for accountability as applied to measuring proficiency in mathematics or science; while projects in the Secondary and Transition Services program may study assessments for accountability within the context of secondary or transition services. Projects on assessment for accountability may study a variety of topics such as new assessment approaches, accommodations, alternate assessments based on alternate or modified achievement standards, individual student growth models for accountability purposes, universal design and accessible assessments, and other topics.

***b. Requirements for measurement proposals in the Special Education Research Grants Programs.***

Applicants under Goal Five should propose to develop assessments that can be used in education delivery settings for students with disabilities from pre-kindergarten through grade 12. Applications that would be appropriate for consideration under Goal Five include, but are not limited to: (a) proposals to develop new assessments; (b) proposals to modify or adapt existing assessments; (c) proposals to adapt assessments originally designed and used for research purposes for broader use in instructional settings; and (d) proposals to develop or test new techniques for assessment or analysis of assessment data in the context of state accountability standards and systems.

Applicants must provide a compelling rationale to support the development of the proposed assessment. Reviewers will consider the strength of theoretical foundation for the proposed assessment, the existing empirical evidence supporting the proposed assessment, and whether the proposed assessment duplicates existing assessments. In developing these assessments, researchers should keep in mind the pragmatic constraints (e.g., number of students, limited class time, time required to train teachers to use the assessments, costs) that teachers and administrators will consider to determine whether the instrument is a viable option for use in classrooms and other education delivery settings. Applications should provide sufficient description of the proposed assessment and how it could be utilized within education delivery settings for reviewers to judge the practicality of the proposed assessment for instructional purposes. Applications on assessment for accountability should provide sufficient description of the proposed assessment instrument or technique in the context of state and federal accountability policies so that reviewers are able to judge the merits and feasibility of the proposed research on assessment for accountability.

*By describing the theoretical and empirical support for the proposed assessment, the practical utility of the assessment, and the components of the assessment, applicants are addressing aspects of the significance of their proposal.*

***c. Methodological requirements.*** There are two aspects of the research methodology that applicants must clearly address: (a) the proposed methods for developing the assessment, and (b) the proposed research methods for obtaining evidence of the *validity and reliability* of the instrument.

- (i) ***Assessment development.*** Applicants must detail the proposed procedures for developing the assessment. Strong applications will include descriptions of: (a) the procedures for determining the constructs that will be "tapped" by the instrument; (b) the procedures for selecting items to be used in the assessment, including assessing difficulty of selected items, and obtaining representative responses to items; and (c) the process for determining the administrative procedures for conducting the assessment (e.g., mode of administration, inclusion/exclusion of individual test takers, and whether make-ups or alternative administrative conditions will be allowed). Applicants should describe the process they will use to collect empirical data that will provide feedback for refining specific components of the assessment. *Applicants should describe the iterative development process to be used in the design and refinement of the proposed measurement tool.*
- (ii) ***Assessment evaluation.*** Applicants must clearly describe the research plans for determining the validity and reliability of the instrument. Applicants should describe the characteristics, size, and analytic adequacy of samples to be used in each study, including justification for exclusion and

inclusion criteria. Applicants should describe detailed planned analytic methods (e.g., statistical and/or psychometric models), plans for treatment of missing responses, and criteria for interpreting results.

**d. *Personnel and resources.*** Competitive applicants will have research teams that collectively demonstrate expertise in (a) content area, (b) assessment, (c) implementation of, and analysis of results from, the research design that will be employed, and (d) working with teachers, schools, or other education delivery settings in which the proposed assessment might be used. Competitive applicants will have access to institutional resources that adequately support research activities and access to schools in which to conduct the research. Applicants should also demonstrate access to statistical and measurement resources and technical expertise needed for developing and studying assessment instruments and techniques.

**e. *Awards.*** Typical awards under Goal Five will be \$150,000 to \$400,000 (total cost = direct + indirect costs) per year for up to 4 years. Larger budgets will be considered if a compelling case can be made for such support. The size of award depends on the scope of the project.

## **PART IV GENERAL SUBMISSION AND REVIEW INFORMATION**

### **6. APPLICATIONS AVAILABLE**

Application forms and instructions for the electronic submission of applications will be available for the programs of research listed in this RFA from the following web site:

<http://www.Grants.gov/>

by the following dates:

Topics with July 26, 2007 Application Deadline Date	April 23, 2007
Topics with November 1, 2007 Application Deadline Date	April 30, 2007

The application form approved for use in the competitions specified in this RFA is the government-wide SF424 Research and Related (R&R) Form (OMB Number 4040-0001).

### **7. MECHANISM OF SUPPORT**

The Institute intends to award grants pursuant to this request for applications. The maximum length of the award period varies by goal. The maximum award length for each goal ranges from two to five years. Please see details for each goal in the [General Requirements of the Proposed Research](#) section of the announcement.

### **8. FUNDING AVAILABLE**

The size of the award depends on the scope of the project. Please see specific details in the [Requirements of the Proposed Research](#) section of the announcement. Although the plans of the Institute include the research programs (topics) described in this announcement, awards pursuant to this request for applications are contingent upon the availability of funds and the receipt of a sufficient number of meritorious applications. The number of projects funded under a specific topic and goal depends upon the number of high quality applications submitted to that topic and goal. The Institute does not have plans to award a specific number of grants under each particular topic and goal.

### **9. ELIGIBLE APPLICANTS**

Applicants that have the ability and capacity to conduct scientifically valid research are eligible to apply. Eligible applicants include, but are not limited to, non-profit and for-profit organizations and public and private agencies and institutions, such as colleges and universities.

### **10. SPECIAL REQUIREMENTS**

Research supported through this program must be relevant to U.S. schools.

Recipients of awards are expected to publish or otherwise make publicly available the results of the work supported through this program. The Institute asks IES-funded investigators to submit voluntarily to the Educational Resources Information Center (ERIC) an electronic version of the author's final manuscript upon acceptance for publication in a peer-reviewed journal, resulting from research supported in whole or in part, with direct costs from the Institute. The author's final manuscript is

defined as the final version accepted for journal publication, and includes all modifications from the peer review process.

Applicants should budget for one meeting each year in Washington, DC, with other grantees and Institute staff for a duration of up to 3 days of meetings. At least one project representative should attend the three-day meeting.

The Institute anticipates that the majority of the research funded under this announcement will be conducted in field settings. Hence, the applicant is reminded to apply its negotiated off-campus indirect cost rate, as directed by the terms of the applicant's negotiated agreement.

Research applicants may collaborate with, or be, for-profit entities that develop, distribute, or otherwise market products or services that can be used as interventions or components of interventions in the proposed research activities. Involvement of the developer or distributor must not jeopardize the objectivity of the evaluation. Applications from or collaborations including such organizations should justify the need for Federal assistance to undertake the evaluation of programs that are marketed to consumers and consider sharing the cost of the evaluation, as well as sharing all or a substantial portion of the cost of the implementation of the product being evaluated (e.g., sharing the cost of textbooks for students).

The Institute strongly advises applicants to establish a written agreement among all key collaborators and their institutions (e.g., principal and co-principal investigators) regarding roles, responsibilities, access to data, publication rights, and decision-making procedures within 3 months of receipt of an award.

## **11. LETTER OF INTENT**

A letter indicating an applicant's intent to submit an application is optional, but encouraged, for each application. The letter of intent form must be submitted electronically by the date listed at the beginning of this document, using the instructions provided at: <https://ies.constellagroup.com>.

The letter of intent should include:

- Descriptive title;
- Topic and goal that the applicant will address;
- Brief description of the proposed project;
- Name, institutional affiliation, address, telephone number and e-mail address of the principal investigator(s);
- Name and institutional affiliation of any key collaborators and contractors;
- Duration of the proposed project;
- Estimated budget request for each year; and
- Total budget request.

The project description should be single-spaced and should not exceed one page (about 3,500 characters). Although the letter of intent is optional, is not binding, and does not enter into the review of a subsequent application, the information that it contains allows Institute staff to estimate the potential workload to plan the review.

## **12. SUBMITTING AN APPLICATION**

Applications must be submitted **electronically by 4:30 p.m., Washington, DC time** on the application deadline date, using the ED standard forms and the instructions provided at the following web site:

<http://www.Grants.gov>

Potential applicants should check this site for information about the electronic submission procedures that must be followed and the software that will be required.

## **13. CONTENTS OF APPLICATION**

All applications and proposals for Institute funding must be contained within specified page limits. Internet Web site addresses (URLs) may not be used to provide information necessary to the review because reviewers are under no obligation to view the Internet sites.

All of the instructions and requirements regarding (a) submission of the application, (b) application page limits, (c) acceptable format, and (d) necessary attachments (.PDF files) will be provided in the **Application Instructions** document for this competition that can be found under the “For Applicants -- Apply for Grants” link of Grants.gov. Also, all of the required forms will be provided in the **Application Package** that accompanies the Application Instructions.

You must search for the downloadable Application Instructions and Application Package for each competition by the CFDA number. Do not include the alpha suffix in your search (e.g., search for 84.324, not 84.324A). For this competition, make sure that you download the “Special Education Research” Application Instructions and Application Package.

In this section, the Institute provides instructions regarding the content of the (a) project summary/abstract, (b) project narrative, (c) bibliography and references cited, (d) biographical sketches of senior/key personnel, (e) narrative budget justification (f) subaward budgets, (g) Appendix A, (h) Appendix B, (i) human subjects narrative, and (j) additional forms. The instructions below will be reiterated in the Application Instructions document for this competition, which will be available, as noted above, under the “For Applicants -- Apply for Grants” link of Grants.gov.

### **A. Project Summary/Abstract**

The project summary/abstract will be submitted as a .PDF attachment, is limited to 1 single-spaced page and must adhere to the margin, format, and font size requirements described in the project narrative section.

The project summary/abstract should include (1) the title of the project; (2) the RFA topic and goal under which the applicant is applying (e.g., development, efficacy); and brief descriptions of (3) the purpose (e.g., to develop and document the feasibility of an intervention); (4) the setting in which the research will be conducted (e.g., rural school districts in Alabama); (5) the population(s) from which the participants of the study(ies) will be sampled (age groups, race/ethnicity, SES); (6) if applicable, the intervention or assessment to be developed or evaluated or validated; (7) if applicable, the control or comparison condition (e.g., what will participants in the control condition experience); (8) the primary research method; (9) if applicable, measures of key outcomes; and (10) if applicable, data analytic strategy.

Please see the website <http://ies.ed.gov/ncser/projects/> for examples of project summaries/abstracts.

## **B. Project Narrative**

The project narrative will be submitted as a .PDF attachment. Incorporating the requirements outlined under the section on [Requirements of the Proposed Research](#), and the requirements listed under the relevant research grant topic, the *project narrative* provides the majority of the information on which reviewers will evaluate the proposal.

The project narrative must include the four sections described below (a. "Significance" through d. "Resources") in the order listed and must conform to the format requirements described on the application submission website.

The project narrative is limited to **25 single-spaced pages** for all applicants. The 25-page limit for the project narrative does not include any of the SF 424 forms, the one-page summary/abstract, the appendices, research on human subjects information, bibliography and references cited, biographical sketches of senior/key personnel, narrative budget justification, sub award budget information or certifications and assurances. **Reviewers are able to conduct the highest quality review when applications are concise and easy to read, with pages numbered consecutively.**

For the purposes of applications submitted under this RFA, a "page" is 8.5 in. x 11 in., on one side only, with 1 inch margins at the top, bottom, and both sides. Text must be single spaced in the narrative. To ensure that the text is easy for reviewers to read and that all applicants have the same amount of available space in which to describe their projects, applicants must adhere to the type size and format specifications for the entire narrative including footnotes. **It is very important that applicants review carefully the "Application Format Requirements" outlined in the *Fiscal Year 2008 Application Package Highlights***, which will be part of the application instructions, to be available on <http://www.Grants.gov> by April 23, 2007.

**a. Significance.** In the [General Requirements of the Proposed Research](#) section and in the subsections describing the requirements for the proposed intervention, the Institute details the information that the applicant should include in order to address the significance of proposed Goal 1, Goal 2, Goal 3, Goal 4, and Goal 5 projects.

For projects in which an intervention or assessment is proposed (whether to be developed or to be evaluated), applicants may use Appendix B to include up to 10 pages of examples of materials to be used by participants (e.g., training materials for teachers, computer screens depicting how information is presented to students, examples of test items for a proposed assessment). Applicants should be aware that all narrative text describing the theoretical background, empirical support, components of the assessment or intervention, or any other aspect of the proposal must be included within the 25-page project narrative. The only materials that are allowed in Appendix B are examples of the materials that are used by or presented to participants in the intervention or assessment.

**b. Methods.** The Methods section of applications for Goal One, Goal Two, Goal Three, Goal Four, and Goal Five should address all of the requirements detailed in the methodological requirements sections for the appropriate research goal.

**c. Personnel.** Applicants must include brief descriptions of the qualifications of key personnel (information on personnel should also be provided in their curriculum vitae) in the research narrative to be compliant with the requirements of the Request for Applications. For each of the key personnel, please describe the roles, responsibilities, and percent of time devoted to the project.

**d. Resources.** Applicants must include a brief description of resources available to support the project at the applicant's institution and in the field settings in which the research will be conducted in the research narrative to be compliant with the requirements of the Request for Applications.

### **C. Bibliography and References Cited**

This section will be submitted as a .PDF attachment. Please include complete citations, including titles and all authors, for literature cited in the research narrative.

### **D. Biographical Sketches of Senior/Key Personnel**

This section will be submitted as a .PDF attachment. Abbreviated curriculum vitae should be provided for the principal investigator(s) and other key personnel. *Each vita is limited to 4 pages and should include information sufficient to demonstrate that personnel possess training and expertise commensurate with their duties (e.g., publications, grants, relevant research experience) and have adequate time devoted to the project to carry out their duties. The fifth page of the attachment should list current and pending grants with the proportion of the individual's time allocated to each project.* The curriculum vita must adhere to the margin, format, and font size requirements described in the project narrative section.

### **E. Narrative Budget Justification**

This section will be submitted as a .PDF attachment and should provide sufficient detail to allow reviewers to judge whether reasonable costs have been attributed to the project. The budget justification should correspond to the itemized breakdown of project costs that is provided in the Research & Related Budget (SF 424) Sections A & B; C, D, &E; and F-K. It should include the time commitments and brief descriptions of the responsibilities of key personnel. For consultants, the narrative should include the number of days of anticipated consultation, the expected rate of compensation, travel, per diem, and other related costs. A justification for equipment purchase, supplies, travel and other related project costs should also be provided in the budget narrative for each project year outlined in the Research & Related Budget (SF 424).

For those applications that include a subaward(s) for work conducted at collaborating institutions, the narrative should also provide the details about the subaward(s). Include the actual subaward budgets as a separate attachment. (See below "[Subaward Budget](#)".)

Applicants should use their institution's federal indirect cost rate and use the off-campus indirect cost rate where appropriate (see instructions under Section 10 Special Requirements). If less than 75 percent of total indirect costs are based on application of the off-campus rate, the applicant should provide a detailed justification.

### **F. Subaward Budget**

This section will be submitted as a .PDF attachment. For applications that include a subaward(s) for work conducted at collaborating institutions, applicants must submit an itemized budget spreadsheet for

each subaward for each project year. As noted above, the details of the subaward costs should be included in the Narrative Budget Justification. An Excel spreadsheet will be provided in the electronic application package to allow applicants to enter the subaward budget information in accordance with the prescribed format. Applicants will complete the spreadsheet in Excel format, convert it to a .PDF file, and then upload it as an attachment.

### **G. Appendix A**

Appendix A should be included at the end of the Project Narrative, and will be submitted as part of the same .PDF attachment.

The purpose of *Appendix A* is to allow the applicant to include any figures, charts, or tables that supplement the research text, examples of measures to be used in the project, and letters of agreement from partners (e.g., schools) and consultants. In addition, in the case of a resubmission, the applicant may use up to 3 pages of the appendix to describe the ways in which the revised proposal is responsive to prior reviewer feedback. These are the only materials that may be included in Appendix A; all other materials will be removed prior to review of the application. Narrative text related to any aspect of the project (e.g., descriptions of the proposed sample, the design of the study, or previous research conducted by the applicant) must be included in the research narrative. Letters of agreement should include enough information to make it clear that the author of the letter understands the nature of the commitment of time, space, and resources to the research project that will be required if the application is funded. The appendix is limited to 15 pages. The Institute recognizes that some applicants may have more letters of agreement will be accommodated by the 15-page limit. In such instances, applicants should include the most important letters of agreement and may list the letters of agreement that are not included in the application due to page limitations.

### **H. Appendix B (optional)**

If applicable, Appendix B should be included at the end of the Project Narrative, following Appendix A, and will be submitted as part of the same .PDF attachment.

Appendix B applies to applications under all topics in this RFA. The purpose of Appendix B is to allow applicants who are proposing an intervention or assessment to include examples of curriculum material, computer screens, test items, or other materials used in the intervention or assessment. These are the only materials that may be included in Appendix B; all other materials will be removed prior to review of the application. Appendix B is limited to 10 pages. Narrative text related to the intervention (e.g., descriptions of research that supports the use of the intervention/assessment, the theoretical rationale for the intervention/assessment, or details regarding the implementation or use of the intervention/assessment) must be included in the 25-page research narrative.

### **I. Research on Human Subjects**

This section will be submitted as a .PDF attachment. If an applicant proposes research activities involving human subjects at any time during the proposed project period, either at the applicant organization or at any other performance site or collaborating institution, then the applicant must provide either a human subjects "exempt research narrative" or a "nonexempt research narrative" and upload this narrative as instructed in the *Fiscal Year 2008 Application Package Highlights*. See the U.S. Department of Education's web page for detailed information about the protection of human subjects in research: <http://www.ed.gov/policy/fund/guid/humansub/overview.html>.

**J. Additional Forms**

Please note that applicants selected for funding will be required to submit the following certifications and assurances before a grant is issued:

- (1) SF 424B-Assurances-Non-Construction Programs
- (2) Grants.gov Lobbying Form
- (3) ED 80-0014 (if applicable)-Lower Tier Certification
- (4) SF-LLL (if applicable) - Disclosure of Lobbying Activities
- (5) Protection of Human Research Subjects assurance and/or Institutional Review Board certification, as appropriate

**14. APPLICATION PROCESSING**

Applications must be received by **4:30 pm, Washington, D.C. time** on the application deadline date listed in the heading of this request for applications. Upon receipt, each application will be reviewed for completeness and for responsiveness to this request for applications. Applications that do not address specific requirements of this request will be returned to the applicants without further consideration.

**15. PEER REVIEW PROCESS**

Applications that are compliant and responsive to this request will be evaluated for scientific and technical merit. Reviews will be conducted in accordance with the review criteria stated below by a panel of scientists who have substantive and methodological expertise appropriate to the program of research and request for applications.

Each application will be assigned to one of the Institute's scientific review panels. At least two primary reviewers will complete written evaluations of the application, identifying strengths and weaknesses related to each of the review criteria. Primary reviewers will independently assign a score for each criterion, as well as an overall score, for each application they review. Based on the overall scores assigned by primary reviewers, an average overall score for each application will be calculated and a preliminary rank order of applications prepared before the full peer review panel convenes to complete the review of applications.

The full panel will consider and score only those applications deemed to be the most competitive and to have the highest merit, as reflected by the preliminary rank order. A panel member may nominate for consideration by the full panel any proposal that he or she believes merits full panel review but would not have been included in the full panel meeting based on its preliminary rank order.

**16. REVIEW CRITERIA FOR SCIENTIFIC MERIT**

The purpose of Institute-supported research is to contribute to the solution of education problems and to provide reliable information about the education practices that support learning and improve academic achievement and access to education for all students. Reviewers for all applications will be expected to assess the following aspects of an application in order to judge the likelihood that the proposed research will have a substantial impact on the pursuit of that goal. Information pertinent to each of these criteria is also described above in the section on Requirements of the Proposed Research, in the section of the relevant research grant topic, and in the description of the project narrative, which appears in the section on Contents of Application.

**A. Significance**

For significance of the project, Goal One applicants need to address the theoretical and empirical rationale for the study and the practical importance of the intervention (e.g., program, practice) that will be examined issues, as outlined in section III.5.B.a (Purpose of identification studies).

For significance of the project, Goal Two and Goal Three applicants need to describe (a) the intervention (e.g., features, components) and the logic model for the intervention, (b) the theoretical and empirical support for the proposed intervention, and (c) the practical importance of the intervention, as detailed in section III.5.C.b (for Goal Two: Requirements for proposed intervention.) and in section III.5.D.b for Goal Three.

For significance of the project, Goal Four applicants need to address the implementation of the intervention as discussed in section III.5.E.c and the requirements for the intervention in section III.5.E.b.

For significance of the project, Goal Five applicants need to describe the theoretical and empirical support for the proposed assessment, the practical utility of the assessment, and the components of the assessment.

**B. Research Plan**

Does the applicant address the requirements described in the methodological requirements section for the Goal under which the applicant is submitting the proposal?

**C. Personnel**

Does the description of the personnel make it apparent that the principal investigator, project director, and other key personnel possess the training and experience and will commit sufficient time to competently implement the proposed research?

**D. Resources**

Does the applicant have the facilities, equipment, supplies, and other resources required to support the proposed activities? Do the commitments of each partner show support for the implementation and success of the project?

**17. RECEIPT AND START DATE SCHEDULE****A. Letter of Intent Receipt Dates:**

Topics with July 26, 2007 Application Deadline Date	May 24, 2007
Topics with November 1, 2007, Application Deadline Date	September 6, 2007

**B. Application Deadline Dates:**

Topics with July 26, 2007 Application Deadline Date	July 26, 2007
Topics with November 1, 2007, Application Deadline Date	November 1, 2007

**C. Earliest Anticipated Start Date:**

Topics with July 26, 2007 Application Deadline Date	March 2008
Topics with November 1, 2007, Application Deadline Date	July 2008

**18. AWARD DECISIONS**

The following will be considered in making award decisions:

- Scientific merit as determined by peer review
- Responsiveness to the requirements of this request
- Performance and use of funds under a previous Federal award
- Contribution to the overall program of research described in this request
- Availability of funds

## **20. PROGRAM AUTHORITY**

20 U.S.C. 9501 *et seq.*, the “Education Sciences Reform Act of 2002,” Title I of Public Law 107-279, November 5, 2002. This program is not subject to the intergovernmental review requirements of Executive Order 12372.

## **21. APPLICABLE REGULATIONS**

The Education Department General Administrative Regulations (EDGAR) in 34 CFR parts 74, 77, 80, 81, 82, 84, 85, 86 (part 86 applies only to institutions of higher education), 97, 98, and 99. In addition 34 CFR part 75 is applicable, except for the provisions in 34 CFR 75.100, 75.101(b), 75.102, 75.103, 75.105, 75.109(a), 75.200, 75.201, 75.209, 75.210, 75.211, 75.217, 75.219, 75.220, 75.221, 75.222, and 75.230.
