A-B, A-C, A-D, B-C, B-D, and C-D indicate statistically significant differences at $p < .05$ between disability group pairs (A versus B, A versus C, A versus D, B versus C, B versus D, and C versus D, respectively) using Wald tests.

ns=no significant differences; †=interpret data with caution. Estimate is unstable because the standard error represents 30 to 50 percent of the estimate; #=rounds to zero; †=not applicable; ‡=reporting standards not met. The standard error represents more than 50 percent of the estimate.

Note: Youth survey respondents, excluding proxies, were asked how strongly they agree that they feel part of the school. The response categories were agree a lot, agree a little, disagree a little, and disagree a lot. Positive views are responses of agree a lot or agree a little. Averages and standard errors are weighted. Sample sizes are unweighted and rounded to the nearest 10.

A-B, A-C, A-D, B-C, B-D, and C-D indicate statistically significant differences at \( p < .05 \) between disability group pairs (A versus B, A versus C, A versus D, B versus C, B versus D, and C versus D, respectively) using Wald tests.

ns=no significant differences; !=interpret data with caution. Estimate is unstable because the standard error represents 30 to 50 percent of the estimate; #=rounds to zero; †=not applicable; ‡=reporting standards not met. The standard error represents more than 50 percent of the estimate.

Note: Youth survey respondents were asked whether they had taken part in any of the following non-school activities in the past 12 months: organized sport supervised by an adult; music, dance, art, or theater lessons; a religious youth group or religious instruction; math, science or computer camps or lessons, volunteer or community service group; scouting or another group or club activity; or another camp or type of non-school activity. Averages and standard errors are weighted. Sample sizes are unweighted and rounded to the nearest 10.

1-2, 1-3, and 2-3 indicate statistically significant differences at p < .05 between subgroup pairs (1 versus 2, 1 versus 3, and 2 versus 3, respectively) using Wald tests.

* = p < .05 for comparison between IEP and No IEP estimates; ns=no significant differences; †=interpret data with caution. Estimate is unstable because the standard error represents 30 to 50 percent of the estimate; #=rounds to zero; †=not applicable; ‡=reporting standards not met. The standard error represents more than 50 percent of the estimate.

Note: Youth survey respondents, excluding proxies, were asked whether they experienced students teasing them or calling them names at school during the school year. Averages and standard errors are weighted. Sample sizes are unweighted and rounded to the nearest 10.
