## Executive Summary

## A. Purpose and design of the study

The National Longitudinal Transition Study 2012 (NLTS 2012) is the third in the series of NLTS studies sponsored by the U.S. Department of Education to examine youth with disabilities receiving services under the Individuals with Disabilities Education Act (IDEA), a long-standing federal law last updated in 2004. Under IDEA, youth with disabilities can be eligible to receive special education and related services through an individualized education program (IEP). The NLTS studies have used survey and administrative data to describe the backgrounds of youth with an IEP and their functional abilities, activities in school and with friends, academic supports received from schools and parents, and preparation for life after high school. The first study, called the NLTS, focused on youth with an IEP ages 13 to 21 in the 1985-1986 school year. The second study, the NLTS 2, focused on youth with an IEP ages 13 to 16 in the 2000-2001 school year. The NLTS 2012 focused on youth with and without an IEP ages 13 to 21 during the 2011-2012 school year.

The NLTS 2012 was designed to address three sets of questions about youth with an IEP and their experiences. Each set of questions involve comparing different groups of youth. The first set of questions pertains to the nature and extent of differences between youth with an IEP and other youth. The NLTS 2012 is the first NLTS to permit direct comparisons of youth with and without an IEP, having included representative samples of both groups. Among the youth without an IEP is a representative set of students who receive accommodations through a plan developed under Section 504 of the Rehabilitation Act, another federal law pertaining to the rights and needs of youth with disabilities. The second set of questions focus on the extent of differences among the disability groups recognized by IDEA: autism, deaf-blindness, emotional disturbance, hearing impairment, ${ }^{1}$ intellectual disability, multiple disabilities, orthopedic impairment, other health impairment, specific learning disability, speech or language impairment, traumatic brain injury, and visual impairment. Critical to the study, and a driving force behind the sampling and weighting plans, is having nationally representative sets of youth from each of these disability groups. The third set of questions concern differences between the current group of youth with an IEP and those in previous decades. The NLTS 2012, when combined with the earlier NLTS and NLTS 2 surveys, provides information on the extent of changes over three decades in the characteristics and experiences of youth receiving special education services.

Three report volumes contain findings from the analysis of the NLTS 2012 data, each of which addresses one of these sets of questions. Volume 1 focuses on comparisons of youth with an IEP and youth without an IEP. Volume 2 focuses on comparisons of youth with an IEP across disability groups. Volume 3 focuses on comparisons of youth with an IEP across time. The publications will be available on the Institute of Education Sciences website for the NLTS 2012 when published.

[^0]
## B. District and youth sample design

The NLTS 2012 used a two-stage national probability sample to produce precise, nationally representative estimates of the backgrounds and experiences of groups of secondary students. The most important groups were youth with an IEP in each of 12 disability groups recognized by IDEA, followed by groups of youth without an IEP, including those with a 504 plan and those with neither a 504 plan nor an IEP. The first stage consisted of selecting a stratified national probability sample of districts and then recruiting those districts to participate. Districts included local education agencies, charter schools that operate independently, and state-sponsored special schools that serve deaf and/or blind youth. The second stage consisted of selecting a stratified sample of youth from each of the districts that agreed to participate. The two-stage sample design resulted in a sample of 21,959 youth in 432 participating districts, who represent a target population of 22.5 million students in grades 7 through 12 or secondary ungraded classes in about 15,000 districts (figure ES1). More detail on data collection results is provided later in this summary.

Figure ES1. NLTS 2012 sample selection and data collection results

Source: National Longitudinal Transition Study 2012.

The sampling design for local education agencies and independent charter schools used three approaches to balance the objectives of generating precise disability group estimates with the efficient use of resources. First, these districts needed to serve a minimum of 30 youth with an IEP to be included in the study. ${ }^{2}$ Second, groups of these districts were combined into district units based on size and geography, so that district units included sufficient youth with an IEP to support data collection. Third, district units were stratified into small, mediumsized, and large district unit strata based on their estimated number of age-eligible youth with an IEP. Study districts were selected as a stratified random sample of district units within each district unit size stratum. Large district units were sampled at a disproportionately higher allocation and small district units were sampled at a disproportionately lower allocation; the medium-sized district units were sampled in proportion to their estimated population size.

The study did not enforce a minimum size requirement for state-sponsored special schools or group them into district units. It selected these schools with certainty and assigned them to a fourth district stratum.

The first-stage sample included 521 local education agencies and charter schools from 300 district units, plus all 51 state-sponsored special schools serving deaf and blind students in the United States. Of the 572 total districts sampled, 432 (or 76 percent) ultimately participated (table ES1).

Table ES1. District participation rate, by district sampling stratum

| District sampling stratum | Number of sampled districts | Number of participating <br> districts | Percentage of districts that <br> participated |
| :--- | :---: | :---: | :---: |
| Large district units | 195 | 154 | 79 |
| Medium-sized district units | 125 | 90 | 72 |
| Small district units | 201 | 151 | 75 |
| Special schools | 51 | 37 | 73 |
| Total | 572 | 432 | 76 |

Note: Large, medium-sized, and small district unit strata include local education agencies and charter schools.
Source: National Longitudinal Transition Study 2012.
Participating districts provided a list of their youth attending grades 7 to 12 , and their youth attending secondary ungraded classes who were ages 13 or older as of December 1, 2011. The study selected a stratified random sample of youth from the lists that participating districts provided. After the samples were selected, district staff provided student and parent contact information for each of the sampled youth. The 14 youth sample strata included the 12 IDEA disability groups, youth with a 504 plan but no IEP, and those with neither a 504 plan nor an IEP (table ES2). The 21,959 youth selected for the study sample included 17,476 youth with an IEP, 1,168 youth with a 504 plan but no IEP, and 3,315 youth with neither a 504 plan nor an IEP. For the IDEA disability groups, the study aimed to have larger respondent samples in the groups that are more prevalent in the student population.

[^1]Table ES2. Number of youth eligible and selected for the study sample, by youth sampling stratum

| Youth sampling stratum (disability groups) | Number of sampled youth |
| :--- | ---: |
| All youth | $\mathbf{2 1 , 9 5 9}$ |
| IEP | 17,476 |
| Autism | 1,648 |
| Deaf-blindness | 191 |
| Emotional disturbance | 2,299 |
| Hearing impairment | 942 |
| Intellectual disability | 2,092 |
| Multiple disabilities | 1,610 |
| Orthopedic impairment | 797 |
| Other health impairment | 2,119 |
| Specific learning disability | 2,980 |
| Speech or language impairment | 1,899 |
| Traumatic brain injury | 470 |
| Visual impairment | 429 |
| No IEP | 4,483 |
| 504 plan but no IEP | 1,168 |
| Neither 504 plan nor IEP | 3,315 |

## C. Content of youth and parent survey instruments

The parent and youth survey instruments used items from prior NLTS surveys as well as new items developed for the NLTS 2012 to address current policy-relevant issues.

The parent survey. The parent survey covered the following topics:

- Disabilities and abilities, including whether youth have a disability and, if so, what kind. It also covers whether they have had an IEP or a 504 plan, and their functional abilities.
- School enrollment and service receipt, including youth enrollment and graduation status, whether they were ever suspended or expelled, receipt of special education and related services, and other supports received through the school.
- Parents' involvement in their children's education, including whether parents attend school events, meet with teachers, help with homework, and participate in IEP and transition planning meetings.
- Parents' expectations for their children's futures, including how much education they think youth will obtain, challenges in furthering education and employment, and expected living arrangements and financial independence.
- Background characteristics and socioeconomic status, including household size; the primary language used at home; youths' race and ethnicity; parents' income, education, and marital status; and household receipt of federal financial assistance.

The youth survey. The youth survey covered the following topics:

- Perceptions about school, including coursework, relationships with staff, and experiences with bullying.
- Receipt of academic supports through school, including supplementary academic instruction outside of regular school hours.
- Participation in IEP and transition-planning meetings, including whether youth attended these meetings and their role in defining their educational goals.
- Extracurricular and social activities, including participation in school-sponsored sports and clubs, other organized activities outside of school, and interactions with friends.
- Employment experiences, including paid employment and school-sponsored work activities.
- Expectations for the future, including those for postsecondary education and independent living.
- Indicators of self-determination, including indicators of personal autonomy and self-direction.

The study refined the survey instruments three times. The most substantial change involved converting the survey from a telephone survey to a web questionnaire. The survey instruments indicate the refinements that the study made to them over time. The restricted-use data file (RUF) includes a variable indicating the version of the instrument used for each respondent.

## D. Data collection methods, procedures, and results

Data collection was conducted from February through October 2012 and from January through August 2013. The study revised the data collection strategies and continued data collection in 2013 to address low response rates during 2012. Survey administration in 2012 was by computer-assisted telephone interviewing. In 2013, the study introduced a web survey option and field interviewers. In addition, parent survey respondents received a portion of their cash incentive payment in advance. During both years, the study needed to contact parents first for youth who were younger than 18. If a parent consented to the study, the parent was surveyed first and subsequently interviewers attempted to survey the youth. This procedure led to a higher response rate among parents than among youth.

Across the two years of data collection, 12,988 parent surveys were completed, representing a 59 percent unweighted response rate and a 57 percent weighted response rate (table ES3). A total of 11,128 youth surveys were completed ( 86 percent of the parent respondents), representing a 51 percent unweighted response rate and a 48 percent weighted response rate of the full youth sample (table ES4). Youth were ages 12 to 23 when interviews took place, with the vast majority (greater than 97 percent) ages 13 to 21 . Less than two percent were 12 years old, and less than one percent were 22 or 23 years old. All students were enrolled in grades 7 through 12 or in a secondary ungraded class at the time of sampling.

Table ES3. Parent survey response rates, by disability group

| Disability group | Total unweighted sample | $\begin{gathered} \text { Completed } \\ \text { surveys } \\ \text { (unweighted) } \end{gathered}$ | Unweighted response rate | Total weighted sample | Completed surveys (weighted) | Weighted response rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| All youth | 21,959 | 12,988 | 59\% | 22,161,451 | 12,670,711 | 57\% |
| IEP | 17,476 | 10,459 | 60\% | 2,579,497 | 1,531,665 | 59\% |
| Autism | 1,648 | 1,078 | 65\% | 157,283 | 103,679 | 66\% |
| Deaf-blindness | 191 | 138 | 72\% | 632 | 447 | 71\% |
| Emotional disturbance | 2,299 | 1,231 | 54\% | 229,167 | 123,644 | 54\% |
| Hearing impairment | 942 | 568 | 60\% | 31,702 | 19,250 | 61\% |
| Intellectual disability | 2,092 | 1,331 | 64\% | 254,965 | 165,425 | 65\% |
| Multiple disabilities | 1,610 | 994 | 62\% | 67,970 | 42,078 | 62\% |
| Orthopedic impairment | 797 | 510 | 64\% | 25,359 | 16,724 | 66\% |
| Other health impairment | 2,119 | 1,273 | 60\% | 372,367 | 224,040 | 60\% |
| Specific learning disability | 2,980 | 1,701 | 57\% | 1,303,679 | 755,134 | 58\% |
| Speech or language impairment | 1,899 | 1,079 | 57\% | 110,383 | 65,192 | 59\% |
| Traumatic brain injury | 470 | 293 | 62\% | 14,634 | 8,841 | 60\% |
| Visual impairment | 429 | 263 | 61\% | 11,358 | 7,211 | 63\% |
| No IEP | 4,483 | 2,529 | 56\% | 19,581,954 | 11,139,046 | 57\% |
| 504 plan but no IEP | 1,168 | 664 | 57\% | 355,401 | 198,616 | 56\% |
| Neither 504 plan nor IEP | 3,315 | 1,865 | 56\% | 19,226,553 | 10,940,430 | 57\% |

Note: The weighted response rates use the unit nonresponse adjusted weights.
Source: National Longitudinal Transition Study 2012.

Table ES4. Youth survey response rates, by disability group

| Disability group | Total unweighted sample | Completed surveys (unweighted) | Unweighted response rate | Total weighted sample | Completed surveys (weighted) | Weighted response rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| All youth | 21,929 | 11,128 | 51\% | 22,038,063 | 10,521,016 | 48\% |
| IEP | 17,449 | 8,960 | 51\% | 2,575,964 | 1,302,251 | 51\% |
| Autism | 1,647 | 954 | 58\% | 157,159 | 91,524 | 58\% |
| Deaf-blindness | 191 | 109 | 57\% | 632 | 341 | 54\% |
| Emotional disturbance | 2,287 | 1,052 | 46\% | 227,694 | 104,823 | 46\% |
| Hearing impairment | 941 | 466 | 50\% | 31,676 | 15,751 | 50\% |
| Intellectual disability | 2,090 | 1,146 | 51\% | 254,759 | 141,228 | 55\% |
| Multiple disabilities | 1,607 | 863 | 54\% | 67,863 | 36,428 | 54\% |
| Orthopedic impairment | 797 | 432 | 54\% | 25,359 | 14,040 | 55\% |
| Other health impairment | 2,116 | 1,078 | 51\% | 371,943 | 189,082 | 51\% |
| Specific learning disability | 2,977 | 1,442 | 48\% | 1,302,597 | 639,279 | 49\% |
| Speech or language impairment | 1,898 | 943 | 50\% | 110,311 | 56,135 | 51\% |
| Traumatic brain injury | 469 | 244 | 52\% | 14,613 | 7,371 | 50\% |
| Visual impairment | 429 | 231 | 54\% | 11,358 | 6,247 | 55\% |
| No IEP | 4,480 | 2,168 | 48\% | 19,566,884 | 9,465,925 | 48\% |
| 504 plan but no IEP | 1,168 | 576 | 49\% | 355,401 | 1699,869 | 48\% |
| Neither 504 plan nor IEP | 3,312 | 1,592 | 48\% | 19,211,483 | 9,296,056 | 48\% |

Note: The weighted response rates use the unit nonresponse adjusted weights. The total sample for the youth survey is less than the study sample of 21,959 because the study team learned that 30 youth were institutionalized, incarcerated, deceased, or had joined the military after the parent survey was completed. The study retained these youth in the study sample as well as their completed parent surveys but treated them as ineligible for the youth survey.

Source: National Longitudinal Transition Study 2012.

The response rates by year suggest that the revised data collection strategies in 2013 were an improvement. First, the new strategies helped reach sample members not reached by the 2012 survey (tables ES5 and ES6). In 2012, the unweighted parent survey response rate was 36 percent of 18,258 students in the sample released that year, and the unweighted youth survey response rate was 30 percent. The 2013 data collection increased the response rates for the original 2012 sample by 24 percentage points for parents (to 60 percent) and by 22 percentage points for youth (to 52 percent).

Second, in 2013 the study also attempted to reach members of an additional sample release of 3,701 youth to increase the number of respondents in each disability group. The cases for the additional sample release came from the same student lists that districts had provided and that were used to generate the sample released for data collection during 2012. The response rates were 52 percent for parents and 47 percent for youth from the additional sample released in 2013, each more than 15 percentage points higher than for the sample released in 2012.

Altogether, the 2013 data collection accounted for about half of all surveys collected across 2012 and 2013. Specifically, the 6,366 responses to the parent survey and 5,684 responses to the youth survey obtained during 2013 totaled 49 percent and 51 percent, respectively, of all respondents.

Table ES5. Unweighted parent survey response rates, by disability group and year

| Disability group | Sample released in 2012 |  |  | Sample released in 2013 <br> Response rate in 2013 |
| :---: | :---: | :---: | :---: | :---: |
|  | Proportion responding in 2012 | Proportion responding in 2013 | Cumulative response rate in $2012+2013$ |  |
| All youth | 36\% | 24\% | 60\% | 52\% |
| IEP | 37\% | 24\% | 61\% | 52\% |
| Autism | 42\% | 23\% | 65\% | 71\% |
| Deaf-blindness | 45\% | 28\% | 73\% | n/a |
| Emotional disturbance | 33\% | 23\% | 56\% | 46\% |

| Neither 504 plan nor IEP | 26\% | 22\% | 48\% | 46\% |

$\mathrm{n} / \mathrm{a}=$ not applicable because the study did not release any sample for the disability group in 2013.
Note: The study released 18,258 cases for data collection in 2012 and 3,701 new cases in 2013.
Source: National Longitudinal Transition Study 2012.
Because youth in the study had a wide range of disabilities and needs, the study offered them the following accommodations to help them respond to the survey, if needed:

- Option to participate in the survey by web, by telephone, or in person
- Ability to take breaks, and, if longer breaks were needed, to complete the survey at different points in time
- Use of any assistive technology the youth normally use (for example, optical devices to enlarge print, hearing aids, sign language, or lip reading)
- Option to take the survey in English or Spanish
- Option to have a parent or other household adult translate the survey for youth who do not speak English or Spanish, or to act as a sign language interpreter

Reflecting in part the use of these accommodations, the sampled youth completed most youth surveys ( 84 percent, table ES7). The study permitted the parent survey respondents to act as proxies when youth were unable to provide their own responses even with accommodations ( 16 percent). Proxy responses were most common among youth with deaf-blindness ( 52 percent) and least common among youth with neither a 504 plan nor an IEP ( 3 percent). In addition, a small number of independent youth who were at least age 18 ( 9 respondents) provided their own consent to participate in the study and therefore acted as parent proxies, responding to both the parent and youth surveys. Proxy respondents, whether for the parent or the youth survey, received abbreviated
surveys that omitted questions based on personal opinions, since one person cannot respond from the perspective of another person.

Table ES7. Proxy responses in the youth survey, by disability group

| Disability group | Proxy respondents (percentage) | Total respondents |
| :---: | :---: | :---: |
| All youth | 16 | 11,128 |
| IEP | 19 | 8,960 |
| Autism | 33 | 954 |
| Deaf-blindness | 52 | 109 |
| Emotional disturbance | 8 | 1,052 |
| Hearing impairment | 19 | 466 |
| Intellectual disability | 34 | 1,146 |
| Multiple disabilities | 48 | 863 |
| Orthopedic impairment | 31 | 432 |
| Other health impairment | 8 | 1,078 |
| Specific learning disability | 4 | 1,371 |

## E. Weighting

Two sets of weights are available, each of which has a different use. Each set consists of a weight for the parent survey and one for the youth survey. These two sets of weights, as well as the populations they represent and their intended uses, are as follows:

- All youth weights. These weights are designed for analyses using the full respondent sample. They are particularly appropriate for analyzing measures that do not depend on youth age or grade at the time of the survey. All 12,988 parent survey respondents and 11,128 youth survey respondents have a positive value for these weights. These weights were poststratified so that the weighted count of sample members by age at sample selection (fall 2011) matches the count of all youth (ages 13 to 21) enrolled in public schools during the 2011-2012 school year. The poststratification counted students younger than age 13 as 13 -year-olds, and students older than age 21 as 21 -year-olds.
- Enrolled youth weights. These weights are designed for analyses using the population of youth who were enrolled in school in the reference school year (the 2011-2012 school year for those surveyed in 2012 and the 2012-2013 school year for those surveyed in 2013). They are particularly appropriate for analyzing measures where youth age or grade at the time of the survey is important for interpreting the response. There are 11,853 parent survey respondents and 10,144 youth respondents with a positive value for these weights. These weights were poststratified so that the weighted count of sample members by age at interview matches
the count of all youth (ages 13 to 21) enrolled in public schools during the 2011-2012 school year. This approach addressed the differences among disability groups in the extent to which respondents completed the surveys in 2012 versus 2013. The poststratification counted students younger than age 13 as 13 -yearolds, and students older than age 21 as 21 -year-olds. The three NLTS 2012 report volumes use these weights.

## F. Unit nonresponse bias analysis

Addressing the potential for bias caused by nonresponse has become more important over the past decade because of the downward trend in response rates to surveys. Although low response rates do not necessarily increase nonresponse bias, they do create the potential for such bias (Groves, 2006). The National Center for Education Statistics (NCES) Statistical Standards specify that a nonresponse bias analysis be conducted whenever unit response at any stage of sample selection is less than 85 percent (Standard 4-4-1). The response rates for the parent and youth surveys fell below that threshold, making a nonresponse analysis appropriate.

The study used three methods to assess the potential for nonresponse bias in the NLTS 2012 parent and youth surveys, described in the list that follows. Together, the results from applying these methods suggested that nonresponse adjustments to the weights succeeded in limiting the potential for bias.

1. Using administrative data to examine and adjust for nonparticipation of districts and nonresponse to the surveys. This approach assessed whether nonresponse adjustments to the sampling weights achieved the goal of reducing differences between participants and the full sample on measures available from administrative records for the full sample. The study conducted this analysis both at the district level and at the youth level. At the district level, there were no statistically significant differences between participating and nonparticipating districts on any of the measures examined before or after adjustments to the district sampling weights. At the youth level, the nonresponse adjustments to the youth sampling weights substantially reduced the number of differences between respondents and the full sample. The proportion of variables where a statistically significant difference remained was no larger than what would be expected by chance.
2. Conducting a follow-up survey of nonrespondents to compare parent survey respondents to the full sample on some survey measures. This approach involved conducting a short survey to secure responses to selected survey items from a subsample of parents who had not responded to the NLTS 2012 parent survey. This Nonrespondent Follow-Up Survey (NFS) provided a basis for comparing parent survey respondents to the full sample, including respondents and nonrespondents. The analysis of the NFS pointed to one variable with the greatest potential for bias-the age at which youth first received special education services. Specifically, parent survey respondents appeared to be more likely than nonrespondents to report that their child first received special education at a younger age. The NFS suggested other smaller differences between respondents and nonrespondents in variables that might be correlated with reduced likelihood of receiving special education services before age 8 .
3. Generating an alternative set of weights using responses from the NFS as a sensitivity analysis to gauge whether potential bias in the age youth first received services could appreciably affect the NLTS 2012 report findings. This approach examined how the potential bias in the age at which youth first receive special education services may have affected the measures and intergroup comparisons presented in the NLTS 2012

Volume 1 and 2 reports (Lipscomb et al., 2017a, 2017b). The respondent sample was reweighted so that the distribution of age at which youth first received special education was the same in the respondent sample as in the combined NFS and respondent samples. The analyses in Volumes 1 and 2 were then re-conducted, and the results compared with those reported in the two volumes. The NFS-reweighted sensitivity analysis indicated that this potential source of nonresponse bias does not appreciably affect the main findings in Volumes 1 and 2. While the sensitivity analysis did not specifically examine the Volume 3 findings, that volume includes a subset of the variables covered in Volumes 1 and 2 and hence the results are likely to apply to that volume as well.

## G. Imputation of variables

Two variables critical for analyzing household background characteristics and nonresponse bias had missing values that the study replaced with imputed values. They are described below.

- A binary variable that indicates whether the youth sample member is from a low-income household. This variable is defined as household income below 185 percent of the federal poverty level. Missing values were imputed due to associations between low household income, IEP status, and subsequent outcomes as youth transition to life after high school. The study used a hot deck imputation procedure to impute values for the variable, using other variables that were most highly correlated with whether the household's income was above or below 185 percent of the federal poverty level, as determined from logistic regression models. Just over 7 percent of parent survey respondents have imputed values for this variable.
- The age when the youth first received special education services. Missing values were imputed because of the variable's importance for the unit nonresponse bias analysis. This imputation was based on youth's disability group and when the disability was identified. About 6 percent of parent survey respondents have imputed values for this variable.

## H. Disclosure risk analysis and protection

The NLTS 2012 RUF contains data on all sampled youth in the study. Each record represents a sampled youth and contains information from administrative records and, for survey respondents, data from the parent and youth surveys.

The RUF omits certain data items to protect sample members' confidentiality. These items include birth dates (consolidated into age groups), names of respondents, respondents' contact information, district identifiers, and open-ended responses (transformed into categorical variables). In addition, some less frequent categories of the categorical variables for school type, household language, and race were consolidated. Information from the parent survey question on household income was converted into a categorical variable consisting of $\$ 20,000$ income ranges. Some school-level variables, including the percentage of youth with an IEP and math and reading proficiency rates, were collapsed into categorical indicators. For one variable, data were swapped between records within gender and age group to protect the identity of parent and youth survey respondents, as required for disclosure review board approval.

## Chapter 1. Introduction

The National Longitudinal Transition Study 2012 (NLTS 2012) is the third in the series of NLTS studies sponsored by the U.S. Department of Education to examine youth with disabilities receiving services under the Individuals with Disabilities Education Act (IDEA), a long-standing federal law last updated in 2004. Under IDEA, youth with disabilities can be eligible to receive special education and related services through an individualized education program (IEP). The NLTS studies have used survey and administrative data to describe the backgrounds of youth with an IEP and their functional abilities, activities in school and with friends, academic supports received from schools and parents, and preparation for life after high school. The first study, called the NLTS, focused on youth with an IEP ages 13 to 21 in the 1985-1986 school year. The second study, the NLTS 2, focused on youth with an IEP ages 13 to 16 in the 2000-2001 school year. The NLTS 2012 focuses on youth with and without an IEP ages 13 to 21 during the 2011-2012 school year.

The NLTS 2012 was designed to address three sets of questions about youth with an IEP and their experiences. Each set of questions involves comparing different groups of youth. The first set of questions pertains to the nature and extent of differences between youth with an IEP and other youth. The NLTS 2012 is the first NLTS to permit direct comparisons of youth with and without an IEP, having included representative sets of both groups. The second set of questions focus on the extent of differences among the disability groups recognized by IDEA. Critical to the study, and a driving force behind the sampling and weighting plans, is having nationally representative sets of youth from each of these disability groups. The third set of questions concern differences between the current group of youth with an IEP and those in previous decades. The NLTS 2012, when combined with the NLTS and NLTS 2 surveys, provides information on the extent of changes over three decades in the characteristics and experiences of youth receiving special education services.

Three report volumes contain findings from the analysis of the NLTS 2012 data, each of which addresses one of these sets of questions (see box 1). Together, the volumes are designed to inform efforts by educators and policymakers to address the needs of youth in special education.

> Box 1. Three volumes reporting findings from the National Longitudinal Transition Study 2012
> Preparing for life after high school: The characteristics and experiences of youth in special education
> Volume 1: Comparisons of youth in special education with other youth examines the characteristics of youth in special education overall and how these youth are faring relative to their peers. Comparisons are made between youth with and without an IEP, and within the latter group, those with a disability under Section 504 of the Rehabilitation Act. The findings highlight the distinctive features of the characteristics and experiences of youth with an IEP.
> Volume 2: Comparisons of youth in special education across disability groups describes the characteristics of youth in 12 disability groups based on IDEA 2004 definitions and how these groups of youth are faring relative to one another. The findings highlight the diversity of needs and challenges faced by youth in special education.
> Volume 3: Comparisons of youth in special education over time identifies trends in the characteristics and experiences of youth in special education over the past three decades. The findings highlight the extent of progress students in special education are making.
> Note: The three volumes will be available on the Institute of Education Sciences website for the NLTS 2012 when published.

The NLTS 2012 comprises nearly 13,000 youth, including youth with an IEP ( 81 percent) and youth without an IEP (19 percent). These students were chosen to be representative of all students with and without an IEP in the United States in grades 7 through 12 (or ungraded secondary classes). Among the youth with an IEP are students who represent each of 12 disability categories recognized by IDEA 2004: autism, deaf-blindness, emotional
disturbance, hearing impairment, ${ }^{3}$ intellectual disability, multiple disabilities, orthopedic impairment, other health impairment, specific learning disability, speech or language impairment, traumatic brain injury, and visual impairment. Among the youth without an IEP is a representative set of students who receive accommodations through a plan developed under Section 504 of the Rehabilitation Act (called a 504 plan), another federal law pertaining to the rights and needs of youth with disabilities ( 5 percent of the nearly 13,000 youth). ${ }^{4}$ The sample also includes a representative set of youth who have neither a 504 plan nor an IEP. The study surveyed youth and their parents in 2012 or 2013 when the vast majority of youth ( 97 percent) were 13 to 21 years old. It spans multiple ages and grades to provide a broad view of students' school experiences at a point in time.

This design documentation describes how the NLTS 2012 data were constructed and prepared for analyses. Specifically, it provides information on the NLTS 2012 sample design, the data collection instruments and procedures, and the preparation of the data and analytic weights. It also includes findings from analyses of the potential for nonresponse bias. This report does not cover the ways the NLTS 2012 data were reweighted and combined with data from the NLTS and the NLTS 2 to examine trends for youth with an IEP. The Volume 3 report provides this information, including more detail on steps to make analytic variables and samples comparable, response rates across the studies, and weighting adjustments.

The chapters of this report document the following key information about the NLTS 2012:

- Chapter 2. The sample design, including how districts and youth were selected for the study
- Chapter 3. The content of survey instruments administered to parents and youth
- Chapter 4. An overview of the data collection methods, procedures, and results
- Chapter 5. The preparation and processing of the data
- Chapter 6. The development of weights to maintain a representative sample
- Chapter 7. An analysis of the potential for youth-level nonresponse bias
- Chapter 8. An analysis of the potential for item-level nonresponse bias, summary of the imputation procedures, and an overview of the disclosure protection procedures
- Chapter 9. The selection of analytic variables and development of indices and measures that involve administrative data
- Appendix A. The parent survey instrument
- Appendix B. The youth survey instrument
- Appendix C. Skip logic errors in the surveys
- Appendix D. Supplemental tables of standard errors and design effects
- Appendix E. Supplemental tables for the unit-level nonresponse bias analysis
- Appendix F. Supplemental tables for the item-level nonresponse bias analysis

[^2]
## Chapter 2. District and youth sample design

The National Longitudinal Transition Study 2012 (NLTS 2012) used a two-stage national probability sample. The sample design enabled the study to produce precise, nationally representative estimates of the backgrounds and experiences of secondary school students with an individualized education program (IEP) in each of the 12 disability groups recognized by the Individuals with Disabilities Education Act (IDEA) of 2004, students with a 504 plan but no IEP, and students with neither a 504 plan nor an IEP. The first stage consisted of selecting a stratified national probability sample of districts and then recruiting those districts to participate. The second stage consisted of selecting a stratified sample of youth from each of the districts that agreed to participate. The two-stage sample design resulted in a sample of 21,959 youth in 432 participating districts; those youth represent a target population of 22.5 million students in grades 7 through 12 or secondary ungraded classes in about 15,000 districts (figure 1).

Figure 1. NLTS 2012 sample selection

Source: National Longitudinal Transition Study 2012.

This chapter describes the sample design. The first section provides an overview of the target population and sample design objectives. The next two sections describe the process for selecting and recruiting districts, and for sampling youth from the participating districts.

## A. Overview of target population and sample design objectives

The target population consists of the approximately 22.5 million public school students in the United States in grades 7 through 12 or secondary ungraded classes (table 1). ${ }^{5}$ The focal group within this population consists of the 2.8 million students (ages 13 to 21) who had an IEP, giving them access to special education and related services funded under Part B of IDEA. The target population includes students older than 18 because IDEA permits youth in special education who are unable to complete high school with their same-age peers to remain in school and to continue receiving special education and related services through the year they turn 21 . The numbers of youth in the IDEA disability groups varied widely, from about 1.5 million with specific learning disabilities to 750 with deaf-blindness. Of the 19.7 million students without an IEP, approximately 450,000 (2 percent) had 504 plans. ${ }^{6}$

Table 1. Number and percentage of students in the target population, by disability group

| Disability group | Number of students in <br> the target population | Percentage of all students in the <br> target population |
| :--- | ---: | ---: |
| All youth | $\mathbf{2 2 , 5 0 0 , 0 0 0}$ | 100.00 |
| IEP | $\mathbf{2 , 7 8 0 , 0 0 0}$ | $\mathbf{1 2 . 3 6}$ |
| Autism | 95,000 | 0.42 |
| Deaf-blindness | 750 | 0.003 |
| Emotional disability | 280,000 | 1.24 |
| Hearing impairment | 34,000 | 0.15 |
| Intellectual disability | 303,000 | 1.35 |
| Multiple disabilities | 73,200 | 0.33 |
| Orthopedic impairment | 27,500 | 0.12 |
| Other health impairment | 318,000 | 1.41 |
| Specific learning disability | $1,508,000$ | 6.70 |
| Speech or language impairment | 113,200 | 0.50 |
| Traumatic brain injury | 13,900 | 0.06 |
| Visual impairment | 12,200 | 0.05 |
| No IEP | $19,720,000$ | 87.64 |
| 504 plan but no IEP | 450,000 | 2.00 |
| Neither 504 plan nor IEP | $19,270,000$ | 85.64 |
| Sure |  |  |

Source: Data on total enrollment are for grades 7 to 12 and secondary ungraded from Digest of Education Statistics, 2009, table 35, "Enrollment in public elementary and secondary schools by level, grade, and state or jurisdiction: fall 2007" (Snyder \& Dillow, 2010). Data on counts of youth with an IEP are from table 1-7, "Children and students served under IDEA Part B in the U.S. and outlying areas by age and disability category, Fall 2007," retrieved from www.idea.org in June 2010. Data on youth with a 504 plan are estimated based on Holler \& Zirkel (2008).

The sample design had several objectives. The most important objective was to obtain precise estimates of students' experiences, based on responses to surveys, for each of the 12 IDEA disability groups. Other priorities

[^3]were to obtain estimates with acceptable precision for youth with a 504 plan but no IEP and for other youth without an IEP (those with neither a 504 plan nor an IEP).

The target sample size was 12,000 youth, including 9,600 youth with an IEP and 2,400 youth without an IEP (table 2). Of those without an IEP, the target sample was 600 youth with a 504 plan and 1,800 youth with neither a 504 plan nor an IEP. The specific level of precision varied across disability groups based on their population sizes. For example, a 95 percent confidence interval around a proportion of 0.50 for the 12 IDEA disability groups ranged from plus or minus 0.026 for youth with specific learning disabilities to plus or minus 0.104 for youth with deaf-blindness.

Table 2. Target sample size and precision, by disability group

| Disability group | Target sample size | Half-width of 95\% confidence level at selected proportions |  |
| :---: | :---: | :---: | :---: |
|  |  | . 50 | . 10 |
| All youth | 12,000 | 0.011 | 0.007 |
| IEP | 9,600 | 0.018 | 0.010 |
| Autism | 1,000 | 0.033 | 0.020 |
| Deaf-blindness | 100 | 0.104 | 0.062 |
| Emotional disturbance | 1,200 | 0.030 | 0.018 |
| Hearing impairments | 520 | 0.046 | 0.027 |
| Intellectual disabilities | 1,200 | 0.030 | 0.018 |
| Multiple disabilities | 900 | 0.035 | 0.021 |

## B. District sample selection

The first stage of sampling was to select districts to recruit for the study. The study considered districts to include local education agencies, charter schools that operate independently, and state-sponsored special schools that serve deaf and/or blind youth. The district sampling frame was the 2008-2009 Common Core of Data (CCD), augmented to include 51 state-sponsored special schools. As discussed in the following discussion, district sampling included four strata, three for local education agencies and charter schools and a fourth for special schools.

The sampling design for local education agencies and independent charter schools used three approaches to balance the objectives of generating precise disability group estimates with the efficient use of resources. First, as discussed in the following discussion, local education agencies and charter schools needed to serve at least 30 youth with an IEP to be included in the study. Second, groups of these districts were combined into district units
based on size and geography, so that district units included sufficient youth with an IEP to support data collection. Third, district units were stratified into small, medium-sized, and large district unit strata based on their estimated number of age-eligible youth with an IEP. Large district units were sampled at a disproportionately higher allocation and small district units were sampled at a disproportionately lower allocation; the mediumsized district units were sampled in proportion to their estimated population size.

- Minimum district size. The study included local education agencies and charter schools serving an estimated count of at least 30 age-eligible youth. This cutoff was based on an analysis of potential decision rules, balancing efficiency objectives with a desire to cover as much of the target populations of youth as possible. Imposing this cutoff excluded 29 percent of districts serving youth in grades 7 to 12 and 81 percent of the charter schools, but retained approximately 98 percent of the age-eligible youth with an IEP in local education agencies and 65 percent of the age-eligible youth with an IEP in charter schools. ${ }^{7}$ The cutoff rule also resulted in retaining approximately 98 percent of the age-eligible youth with an IEP in districts in rural areas and 82 percent of the youth with an IEP in districts in areas characterized as distant rural and remote rural using the National Center for Education Statistics (NCES) District Urban-Centric Locale Code. ${ }^{8}$
- Formation of district sampling units. Local education agencies and charter schools were combined based on geographic proximity to other districts so that greater numbers of youth in the low-prevalence disabilities would be available to sample within each unit. Small district units included 30 to 199 youth with an IEP, medium-sized district units included 200 to 374 youth with an IEP, and large district units included 375 or more youth with an IEP. Most large district units consisted of a single large district, although in some metropolitan areas, charter schools were combined with a large district to form a geographically contiguous district unit.
- Stratification by district size. The three district unit size groups (large, medium-sized, and small) constituted strata for district sampling. Among age-eligible youth with an IEP attending schools grouped into these strata, approximately 62 percent were in the large district unit stratum, 16 percent were in the medium-sized district unit stratum, and 22 percent were in the small district unit stratum.

Study districts were selected as a stratified random sample of district units within each district unit size stratum. This stratification implicit stratification was based on geographic region and degree of urbanicity to ensure that the sample reflected the national distribution of youth along these dimensions. Implicit stratification involves sorting the frame by specified background characteristics within strata before sampling and then using a sequential sampling technique. By selecting the sample using implicit stratification within explicit strata, the study ensured that the sample resembled the population covered by the sample frame in terms of these background characteristics.

[^4]The sampling rates were based on a composite size measure that is a function of the estimated number of youth with and without an IEP. The composite size measure results in nearly equal probability samples of youth within the disability groups in each size stratum (Folsom et al., 1987). The size measure for the district unit $d$ is:
(2.1) $\quad S_{d}=\varphi_{I E P} * N_{d, I E P}+\varphi_{\text {NIEP }} * N_{d, N I E P}$
where $\varphi_{\text {IEP }}$ is the global sampling rate for youth with an IEP, $\varphi_{\text {NIEP }}$ is the global sampling rate for youth without an IEP, $N_{d, I E P}$ is the number of youth with an IEP in the district unit, and $N_{d, N I E P}$ is the number of youth without an IEP in the district unit. The study sampled eight large districts with certainty.

Because there are few youth with deafness and/or blindness, the study augmented the sample design with 51 special schools that serve such students. To find these special schools, the study conducted a search for all such schools in the United States. The study did not enforce a minimum size requirement for special schools or group them into district units. It selected these schools with certainty and assigned them to a fourth district stratum.

The first-stage (district) sample included 572 total districts (table 3). These districts included 521 local education agencies and charter schools from 300 selected district units plus all 51 state-sponsored special schools serving deaf and blind students in the United States.

Table 3. Number of districts selected, by district sampling stratum

| District sampling stratum | Number of sampled districts |
| :--- | :---: |
| Large district units | 195 |
| Medium-sized district units | 125 |
| Small district units | 201 |
| Special schools | 51 |
| Total | 572 |

Note: Large, medium-sized, and small district unit strata include local education agencies and charter schools.
Source: National Longitudinal Transition Study 2012.

## C. District recruitment and participation

The study began to recruit districts in June 2011, following sampling. The study considered districts to have participated in the study if they agreed to participate, provided youth sampling frame data, provided contact information, and permitted data collection without extraordinary encumbrances. ${ }^{9}$ Of the 572 districts sampled from the four district sampling strata, 432 participated (table 4). The district participation rate was 76 percent overall and ranged from 72 to 79 percent across the district sampling strata (table 5).

Table 4. Number of districts and special schools at each step toward district participation status

| Step to district participation | Number of districts |
| :--- | :---: |
| Sampled | 572 |
| Agreed to participate (as of December 2011) | 493 |
| Provided youth sampling frame data | 479 |
| Provided contact information | 445 |
| Permitted data collection without extraordinary encumbrances (number ultimately participating) | 432 |

Table 5. District participation rate, by district sampling stratum

| District sampling stratum | Number of sampled districts | Number of participating districts | Percentage of districts that participate |
| :---: | :---: | :---: | :---: |
| Large district units | 195 | 154 | 79 |
| Medium-sized district units | 125 | 90 | 72 |
| Small district units | 201 | 151 | 75 |
| Special schools | 51 | 37 | 73 |
| Total | 572 | 432 | 76 |

Note: Large, medium-sized, and small district unit strata include local education agencies and charter schools.
Source: National Longitudinal Transition Study 2012.

In the large district unit stratum, six participating districts are among the eight that the study sampled with certainty. For analysis purposes (versus sampling purposes), these six districts function as their own strata and do not contribute to the variance. The variance contribution from these primary sampling units (PSUs) is based on the variation among the youth selected from them (that is, the ultimate sampling units). The NLTS 2012 restricted-use data file (RUF) provides analysis stratum and analysis PSU variables that data file users should use in analyses to estimate standard errors correctly. These variables are called c_astratum and c_apsu, respectively.
 youth.

[^5]
## D. Youth sample selection

The study selected youth from participating districts using a two-step process. First, each district provided a list of all youth in the study's target population. Second, the study selected a stratified random sample of youth from each list, and asked districts to provide youth and parent contact information for these youth. The youth sample was selected using 14 strata: the 12 IDEA disability groups, youth with a 504 plan, and other youth without an IEP. Ultimately, 21,959 youth were selected for the study sample, including 17,476 youth with an IEP, 1,168 youth with a 504 plan, and 3,315 other youth without an IEP.

## 1. Constructing the youth sample frame using district lists

To comply with IDEA federal reporting requirements, all districts maintain lists of youth receiving special education services by IDEA disability group. In addition, based on information from the U.S. Department of Education's Office of Civil Rights, most districts also maintain a list of youth with a 504 plan.

Participating districts provided a list of their youth attending grades 7 to 12 , and their youth attending secondary ungraded classes who were ages 13 or older as of December 1, 2011. Districts included the following youth:

- Youth residing in the district service area and attending a district school
- Nonresident youth attending a school in a different district under a sending/receiving relationship with the sampled district
- Nonresident youth whose parents or sending districts paid tuition to the sampled district
- District youth placed in a private school by the district administration
- District youth attending a state school

Districts were asked to include the following data items for each youth sample member: a district-generated unique identification number, as well as the sample member's gender, race, Hispanic ethnicity, date of birth, school or schools attended as of December 2011, grade level or ungraded status at the beginning of the 20112012 school year, IEP status, IDEA disability group (if relevant), and 504 plan status. The data from participating districts were transmitted through a secure website.

The data was checked and edited to conform to a standardized format. District staff were contacted as needed to resolve data anomalies or other issues involving items critical to sample selection, such as IEP status, IDEA disability category, 504 plan status, and age. It was frequently necessary to contact district staff to map locally used disability codes to the federal IDEA categories. If more than one IDEA disability group was indicated, district staff were contacted to determine each youth's primary disability. In the 196 cases in which a primary disability could not be established, the code corresponding to the smallest disability group nationally was applied as the primary disability.

The study categorized two groups of youth as having specific learning disabilities in addition to youth categorized by their district as belonging to this group: (1) youth with developmental delays and (2) youth whose district did not have any information on their disability group (table 6). Developmental delay is an IDEA disability category that is supposed to be used only with students up to age 9 , after which they are categorized into one of the 12 groups if they still need special education and related services. The study treated these youth as having specific
learning disabilities because this disability group is the largest by far, and districts provided no other information to determine into which other groups they may be been reclassified. Similarly, when the district did not have any information on the youth's disability group, the youth was coded as "unknown primary disability." These youth were categorized in the specific learning disability stratum for sampling purposes and throughout this design documentation. However, the NLTS 2012 report volumes do not include these youth in making estimates for youth with specific learning disabilities (although they are included in estimates for all youth with an IEP).

Table 6. District-reported disability categories, by disability group

| Disability group | Autism |
| :--- | :--- |
| Autism | Deaf-blind |
| Deaf-blindness | Emotional disturbance |
| Emotional disturbance | Deaf, hearing impaired |
| Hearing impairment | Intellectually disabled |
| Intellectually disability categories |  |
| Multiple disabilities | Multiple disabilities |
| Orthopedic impairment | Orthopedic impairment |
| Other health impairment | Other health impairment |
| Specific learning disability | Developmentally delayed, specific learning disability, unknown primary IDEA |
| Speech or language impairment | Speech or language impairment |
| Traumatic brain injury | Traumatic brain injury |
| Visual impairment | Visual impairment |

Note: Gifted youth and those with a functional delay but no IEP were considered to not have an identified disability.
Source: National Longitudinal Transition Study 2012.

## 2. Selecting the youth sample

The youth sample was selected in several rounds between late 2011 and spring 2013. The initial rounds were conducted in late 2011 and early 2012, as districts returned contact information over a period of several months. In spring 2013, the study selected additional sample members for selected disability strata because an insufficient number of parents and youth responded during the spring 2012 data collection.

The sampling design stratified youth by: (1) district stratum (large district units, medium-sized district units, small district units, and special schools) and (2) disability group. Within each district stratum, the study defined target sample sizes for the number of completed interviews for each of the 14 disability group strata (the 12 IDEA disability groups, youth with a 504 plan, and youth with neither a 504 plan nor an IEP). For the IDEA disability groups, the study aimed to have larger respondent samples in the groups that are more prevalent in the student population. ${ }^{10}$

Within a disability group and district unit size stratum, the target sample size was estimated by dividing the target number of respondents by the estimated response rate for that disability group. The response rates were estimated using a universal response rate in the first round of data collection and projected response rates in subsequent

[^6]rounds based on the data collected. The target sample size for a group of youth was then proportionally allocated across the participating districts according to each district's weighted total count of students in that group. This process achieved nearly equal selection rates within youth sampling strata in each district unit size stratum.

For disability groups with lower prevalence-deaf-blindness, hearing impairment, multiple disabilities, and visual impairment-the sampling rates were high and the sample size allocated sometimes exceeded the total number of students in the disability group. In such cases, the study sample included all youth in the group. For disability strata with higher prevalence (such as specific learning disabilities, intellectual disabilities, and autism), this procedure did not require any adjustments. Most districts had enough students in their disability groups so that the district's allocation of the sample would not exceed the total number of students in the disability group.

After each round of sample selection, districts provided administrative records on the youth sampled. These data included contact information and background characteristics (table 7).

## Table 7. Contact information and background characteristics provided by districts for sampled youth

## Type of administrative record

Contact information (2011-2012 school year)
Youth's district ID
Youth's first, last, and middle names
Each youth's email address
Primary school each youth attended
An indicator for whether each youth is in one of the following statuses: (1) the youth still attends a school in the district, (2) district funds are used to pay for out-of-district placement, (3) the youth has moved to another district or the district no longer funds the youth's school, or (4) the youth no longer attends school (has dropped out or graduated)
Parents' or legal guardians' names, telephone numbers, mailing addresses, and email addresses
Primary language spoken in the home
Background characteristics (2011-2012 school year)
Number of expulsions
Number of times (not days) suspended during the 2011-2012 school year
English language learner status
Eligibility status for free or reduced-priced lunch at the beginning of the 2011-2012 school year
Source: National Longitudinal Transition Study 2012.

Some cases were classified as ineligible for the study based on the data districts provided. Cases (both youth and their parents) were ineligible if the study found that the youth were ineligible based on age or were institutionalized, incarcerated, in active military service, or deceased. Youth were considered age ineligible if they were not in grades 7 to 12 , or, if they were in a secondary ungraded class, they were not at least age 13 as of December 1, 2011. Altogether, 124 cases (less than 1 percent of the sample) were ineligible for the study. The NLTS 2012 study sample included 21,959 youth, net of the 124 ineligible cases (table 8, see RUF variable d_y_disability).

An additional 30 youth survey respondents were found to be institutionalized, incarcerated, in active military service, or deceased when the study team attempted to contact them after the parent survey was completed. The study retained the parents of these 30 youth in the pool of eligible parents (largely because they had shared useful information), but treated the youth as ineligible for the youth survey. As a result, response rates for the youth survey are based on a sample of 21,929 rather than a sample of 21,959 . Chapter 4 provides more detail on sample releases, data collection, and response rates.

Table 8. Number of youth eligible and selected for the study sample, by youth sampling stratum

| Youth sampling stratum (disability groups) | Number of sampled youth |
| :--- | ---: |
| All youth | $\mathbf{2 1 , 9 5 9}$ |
| IEP | $\mathbf{1 7 , 4 7 6}$ |
| Autism | 1,648 |
| Deaf-blindness | 191 |
| Emotional disturbance | 2,299 |
| Hearing impairment | 942 |
| Intellectual disability | 2,092 |
| Multiple disabilities | 1,610 |
| Orthopedic impairment | 797 |
| Other health impairment | 2,119 |
| Specific learning disability | 2,980 |
| Speech or language impairment | 1,899 |
| Traumatic brain injury | 470 |
| Visual impairment | 429 |
| No IEP | $\mathbf{4 , 4 8 3}$ |
| 504 plan but no IEP | 1,168 |
| Neither 504 plan nor IEP | 3,315 |

Note: The specific learning disability sampling stratum group includes 196 youth with an IEP but unspecified disability. The restricted-used data file variable d_y_disability reports these 196 youth separately.

Source: National Longitudinal Transition Study 2012.

## Chapter 3. Parent and youth surveys

The study administered parent and youth surveys to collect data for the National Longitudinal Transition Study 2012 (NLTS 2012). In general, the parent or guardian of the sampled youth completed the parent survey; in about 0.1 percent of cases, the youth completed it themselves if they had no guardian. Likewise, the youth generally completed the youth survey directly. In 16 percent of cases, a parent or guardian acted as a proxy for youth who could not respond, even with accommodations.

This chapter describes the content of these two survey instruments.

## A. Parent survey

The parent survey instrument used items from prior NLTS surveys as well as new items developed through a review of the literature and in consultation with a technical working group of experts. It consisted of the following nine sections, and is included in appendix A:

- Section A. Information on the respondent's identity, including contact information for the respondent and the youth sample member, as well as the respondent's consent for the parent and youth surveys and for future data collections.
- Section B. The experiences of the youth sample member in school, including enrollment and graduation status, reasons why the youth left school (if applicable), and whether the youth was ever suspended or expelled.
- Section C. Information on the respondent's involvement in the youth's school, such as attending school events, meeting with teachers, helping with homework, and talking about school with the youth sample member.
- Section D. Youth's abilities, disabilities, and services received. Topics included whether the youth sample member had a disability, an individualized education program (IEP), or a 504 plan; any visual, hearing, physical, or communication impairments; any special education and related services that the youth received; and other supports received through the school.
- Section E. Information on IEP and transition-planning meetings at school, including the ways in which the respondent and the youth sample member participated in these meetings.
- Section F. The respondent's expectations for the youth sample member's future, including how much education the youth is expected to obtain, challenges in furthering education and employment, and expected living arrangements and financial independence at age 30.
- Section G. Youth demographics, including race and ethnicity, health insurance coverage, and who the youth sample member lived with during the past school year.
- Section H. Respondent and household demographics, including the size of the household and the respondent's marital status, education level, and employment status. Other questions in this section included household income and receipt of Temporary Assistance for Needy Families, Supplemental Nutrition Assistance Program benefits, and Supplemental Security Income benefits.
- Section I. Additional contact information for the respondent and other people who would know how to contact the respondent or the youth sample member in the future.

## B. Youth survey

The youth survey was designed to be a continuation of the parent survey (and thus starts with section J). Like the parent survey, it used a combination of items from the prior NLTS youth instrument and new items. The instrument contained the following nine sections, and is included in appendix B.

- Section J. An introduction to the study and a request for the respondent's assent for each data collection.
- Section K. Enrollment and experiences at school, including opinions of classes, relationships with school staff, experiences with teasing and other forms of bullying, and accommodations and services received.
- Section L. Youth respondent's participation in IEP and transition-planning meetings.
- Section M. Activities and experiences out of school, including after-school and nonschool activities, getting together and communicating with friends, and computer use.
- Section N. Employment status and history, including school-sponsored paid and unpaid positions and other paid positions; as well as hours of work and earnings, transportation to a job, whether the youth sample member had disclosed any disabilities to the employer, and accommodations at work.
- Section O. Activities that indicate independent living, such as having money to spend, having savings and checking accounts, having bills to pay, having a driver's license, and being registered to vote.
- Section P. Activities that indicate self-determination, including personal autonomy and self-direction.
- Section Q. Expectations for the future, including the amount of education the youth respondent expects to obtain, expected living arrangements and financial independence at age 30 , and challenges in deciding what to do after high school.
- Section R. Other contact information for the respondent and others who would know how to contact the respondent in the future.

## C. Modifications to the parent and youth surveys

The parent and youth surveys, originally designed for computer-assisted telephone interviewing, were modified three times between May 2012 and January 2013, resulting in four versions of each instrument. The unified parent questionnaire and a unified youth questionnaire in appendices $A$ and $B$ are combinations of the four versions, and contain notes on the differences between the survey versions. Chapter 4 provides more detail on the data collection process and the number of parent and youth survey respondents for each version.

1. Section B change. This section of the parent instrument was modified in May 2012 to correct skip logic programming that had caused inadvertent skips of specific items for certain groups of respondents. The skip
logic programming errors affected data on reasons youth left school for 3 to 6 percent of the parent respondent sample (see appendix C for more detail).
2. Moving consent questions. Many respondents hesitated to participate in the survey when asked at the beginning of the survey whether they consented to participate in future study components. In consultation with the Institute of Education Sciences (IES), the study further modified the instruments in August 2012, moving these consent questions from the beginning of the parent and youth surveys to the end.
3. Expanded data collection modes. The most significant change occurred in January 2013, when a selfadministered web-based survey and field follow-up were introduced. Although the parent and youth surveys did not change appreciably in content, switching to a self-administered web-based survey required minor changes to some questions to account for respondents reading the questions themselves rather than interviewers reading the questions to the respondents. Instructions were modified for the same reason. For example, the telephone-mode version of the instruments instructed interviewers to "Code all that apply" on particular items, whereas the self-administered web-based survey instructed respondents to "Mark all that apply." If respondents did not complete the self-administered web-based survey, then field staff contacted them to conduct the survey either in person or by telephone.

Page left intentionally blank for double sided printing

## Chapter 4. Data collection methods, procedures, and results

Data collection was conducted in two phases, February through October 2012 (Phase I) and January through August 2013 (Phase II). The study revised the data collection strategies and continued data collection in 2013 to address low response rates during 2012. Across Phases I and II, the study fielded a total sample of 21,959 cases to obtain a nationally representative sample of youth in each disability group. Surveys were completed for 12,988 parents and 11,128 youth (figure 2).

This chapter discusses the data collection methods and procedures in each phase including the reasons for the changes. The chapter then provides detailed information on the response rates for the parent and youth surveys.

Figure 2. NLTS 2012 sample selection and data collection results

Source: National Longitudinal Transition Study 2012.

## A. Data collection methods and procedures in 2012 (Phase I)

During Phase I, the study attempted to survey a total of 18,258 cases. To minimize the potential for nonresponse bias, the study attempted to locate any sample member with incorrect or insufficient contact information using professional locating services, locating databases such as Accurint, sending letters to nonrespondents, and follow up with schools.

One parent of each youth sample member was asked to complete a 35 -minute questionnaire with a professional interviewer via computer-assisted telephone interviewing (CATI). Parents had the option to complete the survey in English or Spanish. The CATI system was designed to reduce the potential for interviewer error. For example, it included an online help feature so interviewers could access more detailed explanations or definitions for selected items in the surveys.

After the parent survey was completed and consent provided for the youth interview, the youth respondent was asked to complete a 30 -minute CATI questionnaire. Some youth had disabilities that made it difficult to complete the survey by telephone. In these cases, the interviewer could use alternative modes, such as secure instant messaging or video relay. In some cases, parents acted as proxies if the youth could not respond for themselves even with accommodations. Youth also had the option to complete the survey in English or Spanish.

During summer 2012, the study team conducted a small pilot test of using field interviewers to increase the number of responses. The field interviewers used the CATI instrument and secured 161 total responses.

The survey team followed modified procedures for youth ages 18 or older who were living independently, without a parent or guardian. Because they were old enough to consent for themselves, they received an abbreviated version of the parent survey to collect key variables typically asked of parents. In addition, these youth were asked to complete the full youth survey.

Whenever a respondent refused to complete the interview, the interviewer attempted to determine the reason for the refusal and recorded it. Interviewers also rated the strength of the refusal as mild, firm, or adamant. Interviewers re-contacted any mild or firm refusal cases. After three refusals, no matter the strength, the interviewers recoded the case as adamant and did not contact the respondent again.

Of the 4,794 parents and 506 youth in Phase I who initially refused to complete the surveys, some ( 806 or 17 percent for parents and 148 or 29 percent for youth) ultimately completed it. Most cases were coded either as a final refusal after refusing participation multiple times or given a nonresponse status code after interviewers called on varying days and time slices and were unable to make contact.

## B. Data collection methods and procedures in 2013 (Phase II)

Phase II of parent and youth data collection began in January 2013, and field, web, and telephone follow-up continued through August 2013. During Phase II, interviewers attempted to contact a total of 13,977 parents. The study sample included 10,276 cases from the original group who had not responded during Phase I , as well as 3,701 new cases to achieve the targeted number of completed surveys in each stratum.

## 1. Changes in survey procedures between 2012 and 2013

Between the 2012 Phase I data collection and the 2013 Phase II, important changes occurred that affected various components of the 2013 data collection activities. These changes included:

- Enhancing and expanding data collection modes. In 2013, the survey team introduced a self-administered web survey with an in-person field follow-up for parents and youth who did not respond to the web surveys. As in Phase I, the parent survey consisted of a 35-minute questionnaire available in English or Spanish. After the parents completed the survey and provided consent, the youth were asked to complete a 30 -minute questionnaire. Adding a web survey provided another mode to participate for many youth with disabilities because they could complete the survey themselves at their own pace; for some, such as those with hearing impairments, this mode was more comfortable and accessible. Parents and youth could also request to complete the surveys over the telephone with an interviewer if they preferred. Although the parent and youth surveys did not change in content, switching to a web-based survey required the study team to change some questions. For example, phrases from the CATI version such as "please tell me whether you agree ..." were changed to "please choose whether you agree ..." in the web version. Also, some of the open-ended items became closed-ended because it was possible to provide a long list of answer choices in the web survey.
- Use of a cash prepay incentive. To attempt to engage parents in the survey, instead of paying them $\$ 20$ after they completed the survey, a $\$ 5$ cash incentive was paid in advance and an additional $\$ 15$ incentive was offered to respondents when they completed the survey.

## 2. Data collection in Phase II

The web-based data collection began on January 15, 2013, for both the parent and youth surveys. Field interviewing followed, beginning in February. Field interviewers first attempted to locate the parents by telephone. If they were successful, they attempted to conduct the surveys by telephone. If they could not contact parents and complete the interviews by telephone, the field interviewers then attempted to find the sample members' homes and administer the survey in person. Field interviewers often administered the survey by reading aloud the questions and entering the responses into the web survey for the respondents. During in-person visits, if respondents wanted to complete the survey on their own, the interviewers would give the tablet to the respondents. For the surveys completed in person, interviewers provided incentives while they were in respondents' homes.

To ensure the quality of the field data collected in Phase II, the study randomly selected completed cases and confirmed the data were valid. A random sample of about 10 percent of each interviewer's completed cases was validated by contacting respondents by telephone or postcard. Respondents confirmed that the interview indeed took place, that they received their incentive, and that the interviewer behaved appropriately.

## C. Completed parent and youth surveys and response rates

This section first describes the definition of a completed survey for each instrument. It then summarizes the response rates to the parent and youth surveys, and the number of completes by survey version.

## 1. Definition of a completed parent or youth survey

In consultation with Institute of Education Sciences (IES), the study identified 10 critical items in each of the parent and youth surveys. A respondent's survey was considered "completed" if at least 9 of the 10 items were not missing (or there was a logical skip).

The 10 critical items for the parent survey were as follows:

- B1. Youth's enrollment in school status
- B13. Youth ever held back a grade
- One of C1a-C1d. Parent involvement in a general school meeting, school or class event, volunteer activity at school, or parent/teacher conference
- D1. Professional identified youth as having a physical, sensory, learning, or other disability or problem
- D21. Youth's general health status
- One of D32a-c. Youth participation in catch-up courses or double-dosing of classes, or in supplemental instruction or tutoring outside the school day
- E2. Parent met with teachers to set goals youth will achieve after high school (e.g. a transition plan)
- F5. Parent's expectation of how far youth will get in his/her education
- G1. Language other than English used in home
- H2. Number of people age 18 or over in the household

The 10 critical items for the youth survey were as follows:

- K1. Youth's enrollment in school status
- K9a1. Youth received supplemental academic instruction before or after school
- L1. Youth participated in an individualized education program (IEP) meeting
- M1. Youth participated in school activities outside of class
- M2. Youth participated in nonschool activities
- M3. How often youth usually gets together with friends outside of school
- Any of O1a-O1c. Whether youth has allowance, savings account, or checking account
- Section P: Any of the self-determination items P1a-g, P2-8, or P9a-g.
- Q1. Youth's expectation of how far will get in his/her education
- Section N. Youth's participation in paid work and school-sponsored paid or unpaid work

## 2. Response rates

Across the two years of data collection, 12,988 parent surveys were completed for a 59 percent unweighted response rate and a 57 percent weighted response rate (table 9). The weighted response rates, which used the unit nonresponse adjusted weights (see chapter 6), ranged from 54 to 71 percent by youth sampling stratum. A total of 11,128 youth surveys were completed, which is 86 percent of the parent respondents. This total translates to a 51 percent unweighted response rate and a 48 percent weighted response rate (table 10). The weighted response rates ranged from 46 to 58 percent by youth sampling stratum. ${ }^{11}$

Table 9. Parent survey response rates, by disability group

| Disability group | Total unweighted sample | Completed surveys (unweighted) | Unweighted response rate | Total weighted sample | Completed surveys (weighted) | Weighted response rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| All youth | 21,959 | 12,988 | 59\% | 22,161,451 | 12,670,711 | 57\% |
| IEP | 17,476 | 10,459 | 60\% | 2,579,497 | 1,531,665 | 59\% |
| Autism | 1,648 | 1,078 | 65\% | 157,283 | 103,679 | 66\% |
| Deaf-blindness | 191 | 138 | 72\% | 632 | 447 | 71\% |
| Emotional disturbance | 2,299 | 1,231 | 54\% | 229,167 | 123,644 | 54\% |
| Hearing impairment | 942 | 568 | 60\% | 31,702 | 19,250 | 61\% |
| Intellectual disability | 2,092 | 1,331 | 64\% | 254,965 | 165,425 | 65\% |
| Multiple disabilities | 1,610 | 994 | 62\% | 67,970 | 42,078 | 62\% |
| Orthopedic impairment | 797 | 510 | 64\% | 25,359 | 16,724 | 66\% |
| Other health impairment | 2,119 | 1,273 | 60\% | 372,367 | 224,040 | 60\% |
| Specific learning disability | 2,980 | 1,701 | 57\% | 1,303,679 | 755,134 | 58\% |
| Speech or language impairment | 1,899 | 1,079 | 57\% | 110,383 | 65,192 | 59\% |
| Traumatic brain injury | 470 | 293 | 62\% | 14,634 | 8,841 | 60\% |
| Visual impairment | 429 | 263 | 61\% | 11,358 | 7,211 | 63\% |
| No IEP | 4,483 | 2,529 | 56\% | 19,581,954 | 11,139,046 | 57\% |
| 504 plan but no IEP | 1,168 | 664 | 57\% | 355,401 | 198,616 | 56\% |
| Neither 504 plan nor IEP | 3,315 | 1,865 | 56\% | 19,226,553 | 10,940,430 | 57\% |

Note: The weighted response rates use the unit nonresponse adjusted weights.

| Emotional disturbance | 2,287 | 1,052 | $46 \%$ | 227,694 | 104,823 | $46 \%$ |
| Hearing impairment | 941 | 466 | $50 \%$ | 31,676 | 15,751 | $50 \%$ |
| Intellectual disability | 2,090 | 1,146 | $55 \%$ | 254,759 | 141,228 | $55 \%$ |
| Multiple disabilities | 1,607 | 863 | $54 \%$ | 67,863 | 36,428 | $54 \%$ |
| Orthopedic impairment | 797 | 432 | $54 \%$ | 25,359 | 14,040 | $55 \%$ |
| Other health impairment | 2,116 | 1,078 | $51 \%$ | 371,943 | 189,082 | $51 \%$ |
| Specific learning disability | 2,977 | 1,442 | $48 \%$ | $1,302,597$ | 639,279 | $49 \%$ |
| Speech or language impairment | 1,898 | 943 | $50 \%$ | 110,311 | 56,135 | $51 \%$ |
| Traumatic brain injury | 469 | 244 | $52 \%$ | 14,613 | 7,371 | $50 \%$ |
| Visual impairment | 429 | 231 | $54 \%$ | 11,358 | 6,247 | $55 \%$ |
| No IEP | $\mathbf{4 , 4 8 0}$ | $\mathbf{2 , 1 6 8}$ | $48 \%$ | $19,566,884$ | $9,465,925$ | $48 \%$ |
| 504 plan but no IEP | 1,168 | 576 | $49 \%$ | 355,401 | 1699,869 | $48 \%$ |
| Neither 504 plan nor IEP | 3,312 | 1,592 | $48 \%$ | $19,211,483$ | $9,296,056$ | $48 \%$ |

Note: The weighted response rates use the unit nonresponse adjusted weights. The total sample for the youth survey is less than the study sample of 21,959 because the study team learned that 30 youth were institutionalized, incarcerated, deceased, or had joined the military after the parent survey was completed. The study retained these youth in the study sample as well as their completed parent surveys, but treated them as ineligible for the youth survey.

Source: National Longitudinal Transition Study 2012.

The response rates by year suggest that the revised data collection strategies in 2013 were an improvement. First, the new strategies helped reach sample members not reached by the 2012 survey (tables 11 and 12). In 2012, the unweighted parent survey response rate was 36 percent of 18,258 students in the sample released that year, and the unweighted youth survey response rate was 30 percent. The 2013 data collection increased the response rates for the original 2012 sample by 24 percentage points for parents (to 60 percent) and by 22 percentage points for youth (to 52 percent).

Second, in 2013 the study also attempted to reach members of an additional sample release of 3,701 youth to increase the number of respondents in each disability group. The cases for the additional sample release came from the same student lists that districts had provided and that were used to generate the sample released for data collection during 2012. The response rates were 52 percent for parents and 47 percent for youth from the additional sample released in 2013, each more than 15 percentage points higher than for the sample released in 2012.

Altogether, the 2013 data collection accounted for about half of all surveys collected across 2012 and 2013. Specifically, the 6,366 responses to the parent survey and 5,684 responses to the youth survey obtained during 2013 totaled 49 percent and 51 percent, respectively, of all respondents.

Table 11. Unweighted parent survey response rates, by disability group and year

| Disability group | Sample released in 2012 |  |  | Sample released in 2013 |

Because youth in the study had a wide range of disabilities and needs, the study offered them the following accommodations to help them respond to the survey, if needed:

- Option to participate in the survey by web, by telephone, or in person
- Ability to take breaks, and, if longer breaks were needed, to complete the survey at different points in time
- Use of any assistive technology the youth normally use (for example, optical devices to enlarge print, hearing aids, sign language or lip reading)
- Option to take the survey in English or Spanish
- Option to have a parent or other household adult translate the survey for youth who do not speak English or Spanish, or to act as a sign language interpreter

Reflecting in part the use of these accommodations, the sampled youth completed most youth surveys (84 percent, table 13). The study permitted the parent survey respondents to act as proxies when youth were unable to provide their own responses even with accommodations (16 percent). Proxy responses were most common among youth with deaf-blindness ( 52 percent) and least common among youth with neither a 504 plan nor an IEP (3 percent). In addition, a small number of independent youth who were at least age 18 ( 9 respondents) provided their own consent to participate in the study and therefore acted as parent proxies, responding to both the parent and youth surveys. Proxy respondents, whether for the parent or the youth survey, received abbreviated surveys that omitted questions based on personal opinions, since one person cannot respond from the perspective of another person.

Table 13. Proxy responses in the youth survey, by disability group

|  | Proxy <br> (espondents <br> (percentage) | Total <br> respondents |
| :--- | ---: | ---: |
| All youth | 16 | 11,128 |
| IEP | 19 | 8,960 |
| Autism | 33 | 954 |
| Deaf-blindness | 52 | 109 |
| Emotional disturbance | 8 | 1,052 |
| Hearing impairment | 19 | 466 |
| Intellectual disability | 34 | 1,146 |
| Multiple disabilities | 48 | 863 |
| Orthopedic impairment | 31 | 432 |
| Other health impairment | 8 | 1,078 |
| Specific learning disability | 4 | 1,371 |
| Speech or language impairment | 6 | 943 |
| Traumatic brain injury | 16 | 244 |
| Visual impairment | 9 | 231 |
| IEP, unspecified disability | 6 | 71 |
| No IEP | 4 | 2,168 |
| 504 plan but no IEP | 6 | 576 |
| Neither 504 plan nor IEP | 3 | 1,592 |

As discussed in chapter 3, the surveys were modified three times during the study. Table 14 reports the number of parent and youth respondents who completed each of the four versions of the surveys (RUF variable p_version).

Table 14. Number of parent and youth respondents, by survey version

| Survey version | Mode and date range of completed surveys | Parent survey <br> respondents | Youth survey <br> respondents |
| :--- | :--- | ---: | ---: | ---: |
| Launch | CATI: February 20, 2012, to May 16, 2012 | 3,968 | 3,438 |
| Section B change | CATI: May 17, 2012, to August 15, 2012 | 2,146 | 1,661 |
| Moving consent questions | CATI: August 16, 2012, to November 30, 2012 | 508 | 345 |
| Expanded data collection modes | WEB: January 1, 2013, to June 30, 2013 | 6,366 | $\mathbf{5 , 6 8 4}$ |
| Total |  | 12,988 | 1,128 |

Note: The mode of the first three versions of the survey instruments was a computer-assisted telephone interview (CATI). The "expanded data collection modes" version of the survey instruments was a self-administered web survey and included an in-person follow-up for initial nonrespondents.

Source: National Longitudinal Transition Study 2012.

Finally, table 15 shows the number of parent completes by disability group and youth age at the time of the survey (RUF variable p_y_age). Youth were ages 12 to 23 when interviews took place, with the vast majority (greater than 97 percent) ages 13 to 21 . Specifically, less than two percent were 12 years old, and less than one percent were 22 or 23 years old. All students were enrolled in grades 7 through 12 or in a secondary ungraded class at the time of sampling.

Table 15. Number of completed parent surveys, by disability group and youth age

| Disability group | Age 14 or younger | Age $\mathbf{1 5}$ to $\mathbf{1 8}$ | Age $\mathbf{1 9}$ or older | Total completes |
| :--- | ---: | ---: | ---: | ---: |
| All youth | $\mathbf{3 , 4 5 0}$ | $\mathbf{7 , 7 6 2}$ | $\mathbf{1 , 7 7 6}$ | 12,988 |
| IEP | $\mathbf{2 , 7 4 8}$ | $\mathbf{6 , 1 1 9}$ | $\mathbf{1 , 5 9 2}$ | 10,459 |
| Autism | 303 | 631 | 144 | 1,078 |
| Deaf-blindness | 31 | 73 | 34 | 138 |
| Emotional disturbance | 292 | 794 | 145 | 1,231 |
| Hearing impairment | 149 | 335 | 84 | 568 |
| Intellectual disability | 262 | 720 | 349 | 1,331 |
| Multiple disabilities | 214 | 523 | 257 | 99 |
| Orthopedic impairment | 132 | 282 | 96 | 510 |
| Other health impairment | 335 | 817 | 121 | 1,273 |
| Specific learning disability | 427 | 1,067 | 207 | 1,701 |
| Speech or language impairment | 482 | 547 | 50 | 1,079 |
| Traumatic brain injury | 59 | 172 | 62 | 293 |
| Visual impairment | 62 | 158 | 43 | 263 |
| No IEP | 702 | 1,643 | 184 | $\mathbf{2 , 5 2 9}$ |
| 504 plan but no IEP | 188 | 423 | 53 | 664 |
| Neither 504 plan nor IEP | 514 | 1,220 | 131 | 1,865 |

Note: Youth age is reported at the time of the parent survey.

## Chapter 5. Data preparation

After the survey and administrative data were collected, the study implemented several procedures to enhance the quality of the data. This chapter first describes the file preparation and data editing procedures and then the procedures for coding specific data items.

## A. File preparation and data editing procedures

The data editing process began with the programming of the surveys, continued throughout data collection, and culminated with standardizing and then reviewing the final data files. This section provides information on how data items collected through the surveys were (1) standardized across the different versions of the survey instruments, (2) checked for data quality and completeness during data collection, (3) cleaned and checked for data quality following data collection, and (4) adjusted for missing data due to a programming error.

## 1. Standardization of variables across the different versions of the instruments

Before data collection started, the study determined the ranges for closed-ended responses for the parent and youth surveys. For questions without predetermined ranges, such as wages or age (open-ended responses), ranges were created before data collection and programmed into the survey instruments for consistency. The study standardized variable names and response codes in the parent and youth surveys across the multiple versions of the survey (see chapter 3).

## 2. Checks for data quality and completeness during data collection

To help ensure the quality of responses during data collection, the parent and youth survey instruments contained several soft and hard range data checks. These checks activated when a respondent provided answers outside the range of what would be expected of the average respondent. Soft checks triggered when a response was outside the typical range, but was allowable, and they required the respondent to reenter the response before advancing in the survey. Hard checks did not allow the respondent to advance in the survey until the response fit in an acceptable range or predetermined response category.

The surveys included logic checks that were designed to minimize the burden on respondents and avoid illogical responses. The survey instrument contained checks for internal consistency between some responses. In the computer-assisted telephone interviewing (CATI) version of the survey, these checks triggered a pop-up box when a response directly conflicted with a previous answer or appeared unlikely based on previous items. The pop-up box prompted interviewers to return to previous items and confirm the answers. For example, suppose parents reported that their child was expelled or suspended from school in a higher grade than the child's current grade, as reported at the start of the survey. In this example, the survey would prompt the interviewer to check the responses because the responses were not compatible. For the web survey, the logic checks were removed because the cross-checks and warnings could add extensive burden and cause frustration for respondents, who might refuse to complete the survey. Team members cross-checked these items after data collection and found that four cases violated the logic checks. During the cleaning process, the discrepant items were set to missing.

## 3. Data cleaning after data collection

After preparing the unified parent and youth data files and completing the status code reconciliation, the team created a cleaning program to output data inconsistent with the skip logic patterns in the parent and youth survey files. Data preparation team members reviewed the frequency distributions of individual items and crosstabulations of related items one by one to confirm that the items followed a uniform and appropriate skip pattern. Some questions in the instruments were asked only of respondents who provided a particular response to a prior question. Data cleaning processes checked that the correct number of responses and appropriate skips occurred for each question based on the intended programming logic specifications.

## 4. Addressing missing data due to skip logic errors

During the final phase of data collection checks, the study team discovered that a programming error sometimes led to inadvertent skips of specific items for some respondents to the original and web-based versions of the parent survey. The error affected 14 items in the parent and youth surveys. All of the affected items were in the parent survey except for one-whether youth ages 16 and above reported having met with school staff to develop a transition plan. For this item, data are missing for 16 year olds who responded to the youth survey in 2012.

Typically, errors affected at most 6 percent of the respondents. One exception was an item that asked parents whether they expected the youth would be enrolled in secondary school next year. This item affected 16 percent of respondents. Missing values due to skip logic errors are denoted with a ".v" in the data file. Appendix C, table C-1 indicates the question numbers affected by unintentional skips (including the error in Section B of the first version of the instrument, which is described in chapter 3), along with the number of cases affected.

## B. Coding

The survey instruments included data on several variables that required coding after data collection ended. These were all closed-response items with an "other, specify" option. This section describes the types of data that required coding and the coding process, including the quality control procedures used during coding.

## 1. Types of data that required coding

Twenty-seven questions from the parent survey and 12 questions from the youth survey allowed respondents to enter an "other, specify" response. These questions pertain to youth experiences in school; youth disability status and accommodations; plans for the future; and youth, parent, and household demographics. To standardize the application of the "other, specify" responses, the study coded the data collected in Phases I and II at the same time. New codes were incorporated into the data file when five or more responses were the same and if that new category constituted a specific response to the question. Open-ended responses to some youth survey items that pertained broadly to indecision were not coded into a separate category. The new codes are indicated in the instrument versions in appendices A and B .

## 2. The coding process

The coding process was designed to maximize accurate, consistent coding across coders. The surveys included applications that allowed respondents or telephone interviewers to code text strings to existing options. All text strings not coded during the interview were coded as part of data processing. Staff were trained to implement the following standard processes to ensure best coding practices:

- Frequency report quality check. The study reviewed the frequency distribution for each question containing an "other, specify" response weekly for high rates of noncodable responses. If an item had 20 percent or more noncodable responses it was flagged for review to determine whether to add new categories.
- 10 percent quality check. To evaluate the quality of the coding completed by the coding team, a random sample of 10 percent of the "other, specify" responses and codes was selected to be independently coded by a team member. A recoded response was verified as correct if the second coding yielded the same result. The quality assurance coders verified that 98 percent of the reviewed responses were correct. Codes that were not correct were discussed with the coding team to ensure the accuracy of the coded items in the final database.

For both the parent and youth surveys, the coding process classified 85 percent of "other, specify" responses into numerically-coded categories. The remaining 15 percent could not be coded. Newly created codes or response options are indicated with an asterisk $\left(^{*}\right)$ in the parent survey instrument (appendix A) and the youth survey instrument (appendix B).

Page intentionally left blank for double-sided printing

## Chapter 6. Development of analysis weights

Analysis weights were generated for each completed parent and youth survey, consistent with the sampling probabilities and then adjusted to compensate for sampled districts, parents, and youth that did not participate in the surveys. This chapter first provides a brief description of two alternative sets of weights available in the restricted-use data file (RUF) and their intended uses. It then describes the weight development process. Finally the chapter describes the standard errors and design effects associated with the weight adjustments.

## A. Overview of two sets of analysis weights

The RUF includes two sets of weights. Each set consists of a weight for the parent survey and one for the youth survey. The two sets of weights differ based on (1) whether they include a positive weight for youth not enrolled in high school at the time of the survey, and (2) how the weights were poststratified (that is, adjusted so that the weighted number of youth for a group of sample members matches known values for the target population). The two sets of weights, as well as the populations they represent and their intended uses, are as follows:

- All youth weights. These weights (for both parent and youth survey data) are designed for analyses using the full respondent sample. They are particularly appropriate for analyzing measures that do not depend on youth age or grade at the time of the survey. For example, it would be appropriate to use these weights to tabulate a measure such as the percentage of youth who are female. All 12,988 parent survey respondents and 11,128 youth survey respondents have a positive value for these weights. These weights were poststratified so that the weighted count of sample members by age at sample selection (fall 2011) matches the count of all youth (ages 13 to 21) enrolled in public schools during the 2011-2012 school year. Students younger than age 13 or older than age 21 were counted as 13 or 21 year olds, respectively, in the weighting. The RUF variables for these parent and youth weights are p_weight_allyouth and y_weight_allyouth, respectively.
- Enrolled youth weights. These weights (for both parent and youth survey data) are designed for analyses using the population of youth who were enrolled in school in the reference school year (the 2011-2012 school year for those surveyed in 2012 and the 2012-2013 school year for those surveyed in 2013). They are particularly appropriate for analyzing measures where youth age or grade at the time of the survey is important for interpreting the response. For example, it would be appropriate to use these weights to tabulate a measure such as the percentage of youth who took a college entrance or placement test. There are 11,853 parent survey respondents and 10,144 youth respondents with a positive value for these weights. These weights were poststratified so that the weighted count of sample members by age at interview matches the count of all youth (ages 13 to 21) enrolled in public schools during the 2011-2012 school year. Students younger than age 13 or older than age 21 were counted as 13 or 21 year olds, respectively, in the weighting. The three NLTS 2012 report volumes use these weights. The RUF variables for these parent and youth weights are p_weight_enrolledyouth and y_weight_enrolledyouth, respectively.

Table 16 shows, for each set of weights, the unweighted sample counts for groups of students based on age, race/ethnicity, gender, and disability group and their weighted percentage of the population.

Table 16. Number of observations and weighted percentages of the population for groups of youth based on demographic characteristics and disability group, by type of analysis weight and survey respondent

| Youth group | All youth weights |  |  |  | Enrolled youth weights |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Parent survey |  | Youth survey |  | Parent survey |  | Youth survey |  |
|  | Number of observations | Weighted percentage | Number of observations | Weighted percentage | Number of observations | Weighted percentage | Number of observations | Weighted percentage |
| All youth | 12,988 | 100.0 | 11,128 | 100.0 | 11,853 | 100.0 | 10,144 | 100.0 |
| Demographic characteristic |  |  |  |  |  |  |  |  |
| 14 years old or younger | 5,186 | 45.5 | 4,585 | 45.7 | 3,414 | 45.4 | 3,011 | 45.4 |
| 15 to 18 years old | 7,028 | 53.6 | 5,907 | 53.4 | 7,391 | 53.6 | 6,281 | 53.6 |

## B. Weight development process

The analysis weights account for several factors: the probability that a district was selected and participated in the study, the probability that a youth was selected for the sample from among the participating districts, and the probability that the parent and youth respondent completed the surveys. For both the parent and youth surveys, the weights were developed using a five-step process:

1. Compute the district-level weight
2. Compute the youth-level base weight using the district weight and youth selection rate
3. Adjust the youth-level base weights for parent and youth nonresponse
4. Poststratify the weights based on total counts of youth enrolled
5. Identify and adjust extreme-valued weights

Each of these steps are described in the sections that follow.

## 1. Compute the district-level weight

The district-level weight accounted for the probability that each district was selected, the exclusion of districts serving small numbers of youth with an individualized education program (IEP), and nonparticipation by some sampled districts. It was then poststratified to match the count of all age-eligible students in the original sampling frame (the 2008-2009 Common Core of Data [CCD] file).

Specifically, as discussed in chapter 2, districts were selected for the study with probability proportional to a district size measure. The district-level base weight is equal to the inverse of their probability of selection. The study then poststratified the base weight to account for the exclusion of districts with fewer than 30 youth with an IEP. This poststratification (the first of two poststratifications for the district-level weights) was designed to match the total count of students in the districts in the original sampling frame by categories of enrollment size, urbanicity in the area served, and geographic region.

The study then adjusted the district weights for district nonparticipation. As described in chapter 2, 76 percent (432 of 572) of the sampled districts agreed to participate in the study. The nonparticipation weight adjustment was based on three progressively sophisticated analyses:

- Cross-tabulations. An initial set of cross-tabulations identified some differences in response across groups of districts by district characteristics (table 17). The bivariate analysis was expanded based on interactions exhibited among variables shown by the multivariate analysis described next.
- Chisquare Automatic Interaction Detect (CHAID) multivariate analysis. This analysis identified more fine grained subgroups-defined based on interactions of district characteristics-with different response propensities. ${ }^{12}$

[^8]- Logistic regressions. These regressions further isolated factors associated with response using a multivariate analysis method. The regressions dropped factors that had been identified by CHAID but were no longer associated with response after controlling for the other factors. Forward and backward stepwise logistic regressions identified a pool of possible variables for the final logistic regression model. ${ }^{13}$

Table 17. Measures used to adjust district-level weights for district nonparticipation

| Measure | Level | Source |
| :---: | :---: | :---: |
| Indicator for large, medium-sized, and small district units | District | CCD |
| U.S. Department of Education region of the district | District | CCD |
| Number of students who are grade-eligible for the study | District | CCD |
| Number of students with an IEP | District | CCD |
| Number of students without an IEP | District | CCD |
| Number of students who are nonwhite | District | CCD |
| Number of students who are white | District | CCD |
| Estimated percentage of related children ages 5 to 17 in families in poverty | District | U.S. Census Bureau |
| Percentage of students who are black | School | CCD |
| Percentage of students who are Hispanic | School | CCD |
| Percentage of students who are white | School | CCD |
| Percentage of students eligible for free lunch | School | CCD |
| Percentage of students eligible for reduced-price lunch program | School | CCD |
| Percentage of students eligible for free or reduced-price lunch program | School | CCD |
| School eligibility for Title I programs | School | CCD |
| Types of Title I programs in school | School | CCD |
| NCES urban-centric locale code | School | CCD |
| Total number of students | School | CCD |
| IDEA disability category, Section 504 status | Youth | Participating districts |
| Limited English proficiency indicator | Youth | Participating districts |
| Eligibility for free or reduced-price lunch program | Youth | Participating districts |
| Number of times suspended | Youth | Participating districts |
| Gender | Youth | Participating districts |
| Grade | Youth | Participating districts |
| Hispanic | Youth | Participating districts |

District unit = cluster of one or more adjacent school districts and charter schools; CCD = Common Core of Data.
Note: Districts consist of local education agencies, charter schools that operate independently, and state-sponsored special schools that serve deaf and blind youth.

Source: National Longitudinal Transition Study 2012.
on their response rates (Biggs et al., 1991; Kass, 1980).
${ }^{13}$ This logistic regression minimized the distance between the observed response (scored as a $1-0$ variable) and the estimated propensity scores (a continuous variable between 0.0 and 1.0). This is done using (1) a lower level (alpha = 0.30) for testing whether an estimated coefficient is significantly different from zero (effectively "overfitting" the model by including more variables in the model), and (2) the Hosmer-Lemeshow test of goodness of fit to evaluate among alternative models.

The CHAID analysis and logistic analyses identified three main factors associated with district participation rates, which were used to adjust the weights: district urbanicity, the percentage of related children ages 5 to 17 in families in poverty, and the percentage of enrolled students who are not white. The participation-adjusted districtlevel weight was the product of the district base weight and the district participation adjustment.

Finally, the participation-adjusted district-level weight was poststratified to the number of students in districts by enrollment, urbanicity, and region. This poststratification used counts of age-eligible students from the 20082009 CCD so that the sum of the weighted number of students matched the total number of students in the CCD (including in districts with less than an estimated 30 age-eligible students with an IEP). For the special schools the participation adjustment factor was the inverse of the participation rate.

## 2. Compute the youth-level base weight using the district weight and youth selection rate

The youth-level base weight is the inverse of the sampled youth selection probability. This weight accounts for both the selection of the district and the selection of the youth from lists provided by the district. As described in chapter 2, districts were asked to provide lists of youth enrolled in the 2011-2012 school year. The youth samples were selected independently within each district and within the 12 disability groups as well as the two strata of youth without an IEP. The unadjusted base weight for each sampled youth is the product of the nonparticipation-adjusted district-level sampling weight and the within-district youth sampling weight.

The unadjusted base weight was poststratified so that the weighted numbers of youth equaled population counts provided by the U.S. Department of Education. For youth with an IEP, the base weight was poststratified to the number of enrolled students ages 13 to 21 for each of the 12 Individuals with Disabilities Education Act (IDEA) categories of disabilities during the 2011-2012 school year. The number of students with an IEP by disability group came from EDFacts data. ${ }^{14}$ No enrollment numbers were available for the population of youth without an IEP by age. The weighted number of youth without an IEP was set equal to the difference between the number available for all enrolled youth in the relevant age range in the CCD for the 2011-2012 school year and the number of youth with an IEP. The number of students used for the poststratification are given by age in table 18 and by gender, race/ethnicity, and urbanicity in table 19.

[^9]
## Table 18. Population of students used for poststratification of parent and youth base weights, by age

| Disability group | 13 years or younger | 14 years | 15 years | 16 years | 17 years | 18 years | 19 years or older | All ages |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## 3. Adjust the youth-level base weights for parent and youth nonresponse

The next step was to adjust the base weights to account for nonresponse to the parent and youth surveys. The purpose of this nonresponse adjustment is to reduce the potential for nonresponse bias in weighted survey estimates. The nonresponse adjustments were done separately for each of the 12 strata based on the IDEA disability categories and the 2 strata of youth without an IEP. In addition, separate nonresponse adjustments were performed for the parent survey weights and the youth survey weights. The sections that follow describe the process for (1) identifying youth and parent characteristics associated with nonresponse, and (2) adjusting the weights using these characteristics.

The first step of the nonresponse adjustment process is to identify factors or combination of factors associated with the propensity to respond. As with the district-level analysis, the youth analysis consisted of analyzing crosstabulations, CHAID multivariate analysis, and logistic regressions. These three analyses were conducted for youth in each of the 14 IDEA disability groups and separately for the parent and youth surveys, a total of 28 logistic regressions. The variables used to identify groups with different propensity to respond separately for the parent and youth survey are those listed in table 17.

Following estimation of the 28 logistic regression models, the primary factors associated with response were:

- District-level characteristics (total number of students, number of youth with an IEP, percentage of students who are nonwhite, geographic region, and level of urbanicity)
- Youth-level characteristics (race, grade, and eligibility for free or reduced-price lunch program)

The goal in applying nonresponse adjustments to the final weights is to minimize the potential for nonresponse bias, while also minimizing the sampling variance. Effective nonresponse compensation procedures can achieve both objectives. To compute the nonresponse adjustment, the study multiplied the base weight by a nonresponse adjustment factor corresponding to the inverse of the individual's propensity to respond. The probability of responding is computed using the estimated coefficients of a response propensity logistic regression model and the characteristics associated with the specific youth.

Denoting the youth-level base weight for the $i^{\text {th }}$ youth as $W_{i, h, \text {,outh }}$, where $h$ is the disability group $(h=1,2, \ldots, 14)$ and the nonresponse adjustment for youth $i$ 's weight as $a_{i, h, \text { youth }}$, the response-adjusted weight $A W_{i, h, \text { youth }}$ can be written as:

$$
\begin{align*}
A W_{i, h, \text { youth }} & =a_{i, h, y \text { outh }} \times W_{i, h, y \text { outh }} \text { for all responding youth }  \tag{6.1}\\
& =0 \text { for all other sample members }
\end{align*}
$$

For the parent weight, the study used a similar weight computation based on the logistic model to calculate the estimated probability of the parent of youth $i$ responding (that is, using the inverse of the estimated propensity scores for the nonresponse adjustment).

## 4. Poststratify the weights based on total counts of youth enrolled

The two sets of weights (the all youth weights and the enrolled youth weights) have different analytic populations and required separate poststratification adjustments to population counts, as described in the sections that follow.

All youth weights. The objective for poststratifying the all youth weights was to match the weighted numbers of youth based on their age at sampling with national totals of youth enrolled in school during 2011-2012, the school year in which the sampling frame was constructed. The weights were poststratified separately for parent and youth respondents by disability classification, age at sampling, gender, district, urbanicity, and race/ethnicity. The poststratification counted students age 12 as 13 year olds, and students ages 22 and 23 as 21 year olds.

Enrolled youth weights. The objective for poststratifying the enrolled youth weights was to match the weighted numbers of enrolled youth based on their age at the time of their interview with national totals of youth enrolled in school during the 2011-2012 school year. The procedure accounted for the fact that the surveys were administered over two school years. Youth who responded in 2013 were about one year older, on average, than their counterparts surveyed in 2012. Although nearly all respondents ( 99.5 percent) in 2012 had been enrolled in school during the reference school year for their survey (2011-2012), about 12 percent of those interviewed in 2013 had not attended school during the reference school year for their survey (2012-2013). Overall, about half of respondents were interviewed during each of the two data collection years, but this percentage varied by disability group (for example, the percentage completing the interview in 2012 ranged from approximately 40 to 55 percent). The weighting approach needed to address the differences in the extent to which each group responded to the survey in 2012 versus 2013, which otherwise could distort comparisons among them.

The enrolled youth weights were adjusted in two ways: (1) zero weights were assigned to youth not enrolled in school in their school reference year, and (2) they were poststratified so that the weighted counts equaled the population count of enrolled youth in the 2011-2012 school year for groups defined by their age at the time of their interview. This approach addressed the differences across disability groups in the extent respondents completed the surveys in 2012 versus 2013. Poststratifying based on the age of youth at the time of their interview implicitly assumes that conditions in schools were approximately the same on average for youth enrolled in the two school years. It further assumes that youth interviewed in 2013 had the same characteristics and experiences as youth of the same age in 2012. As with the all youth weights, the poststratification was separate for parent and youth respondents and was also conducted by disability classification, gender, district, urbanicity, and race/ethnicity. The poststratification counted students age 12 as 13 year olds, and students ages 22 and 23 as 21 year olds.

## 5. Identify and adjust the extreme-valued weights

The weight adjustments described above led to a few weights that were substantially larger than the others. These large weights could reduce the precision for estimates. The trimming of a few weights with extreme values has been shown to improve the precision and introduce negligible bias in the survey estimates (Potter, 1990). Extreme weights were identified using an algorithm based on the average of the squared value of the individual weights and the percentile. For the all youth weights, the weights were trimmed for 40 youth ( 0.4 percent) and 41 parents ( 0.4 percent). For the enrolled youth weights, the weights were trimmed for 31 youth ( 0.3 percent) and 17 parents (0.1 percent).

## C. Variance estimation

The sample design for the NLTS 2012 included multiple stages of sampling and stratification with different selection rates of youth across disability groups. Analyses with the NLTS 2012 data should use statistical software with the capabilities of accounting for the complex design. To support the variance estimation, the study developed variance estimation parameters that permit the computation of variance estimates through a Taylor series approximation using only the analytic weight. Many standard software packages calculate estimates under the assumption of a simple random sample design as in traditional mathematical statistics and do not account for the clustering of students within schools. Assuming that the NLTS 2012 is a simple random sample design is not correct and can lead to estimated variances and confidence intervals that are too small. Underestimating the width of confidence intervals can incorrectly lead to conclusions that two groups differ by a statistically significant margin when they do not.

This section first details the procedures to construct these design variables. It then discusses the variance inflation associated with the clustered NLTS 2012 sample design in comparison to an unclustered design, quantified in the design effect.

## 1. Standard errors

For the NLTS 2012, the study developed a variance estimation protocol based on Taylor series linearization. Variance estimation based on Taylor series linearization requires software that incorporates a first-order Taylorseries approximation of the statistic being analyzed (for example, a percentage) as well as data identifying the analysis stratum, the analysis PSU, and the analysis weight (Binder, 1983; Wolter, 2007; Woodruff, 1971). As mentioned in chapter 2, the analysis strata and analysis PSUs are different from those used for sampling and should not be confused.

Various software packages have survey data analysis capability that permits the linearization variance estimation. These include SUDAAN, survey data analysis procedures in SAS, and Stata. ${ }^{15}$ Boxes 2 and 3 provide example program code from SUDAAN and from Stata for producing estimated means and standard errors (the square root of the sampling variance) with the NLTS 2012 RUF.

## 2. Design effects

A design effect (deff) is a measure of the efficiency of a sample design for specific data items collected in the survey. Kish (1965) defined the design effect as the ratio of the variance of an estimate under the complex sample design, $\hat{V}_{d}(\hat{\theta})$, to the variance of the same estimate from a simple random sample of the same size, $\hat{V}_{S}(\hat{\theta})$, for an estimated variable $\hat{\theta}$ :

$$
\begin{equation*}
d e f f=\frac{\hat{V}_{d}(\hat{\theta})}{\hat{V}_{s}(\hat{\theta})} \tag{6.2}
\end{equation*}
$$

The design-based variance in the numerator reflects the effects of stratification, clustering, differential sampling of subpopulations, and differential nonresponse. For the NLTS 2012, youth were clustered in districts and then stratified by disability group for sample selection. The selection rate for each of the disabilities groups was different based on the size of the subpopulation and the sample size desired for that group. For example, youth with neither a 504 plan nor an IEP were selected at a rate of approximately one in 10,000. In contrast, youth with specific learning disabilities were selected at a rate of approximately one in 1,000 and youth with autism were selected at a rate of approximately one in 100 . Youth with traumatic brain injuries or deaf-blindness were selected at even higher rates. For this reason, the deff for youth in specific disability categories is lower than the deff for youth with an IEP overall or for all youth.

A total of 119 estimates from the NLTS 2012 were used to analyze the design effects for groups of youth. These estimates come from seven parent and youth survey measures that are highlighted in the executive summary of Volume 2 as indicators linked with success after high school. These items are also central to the analysis in Volume 1.

1. Percentage of youth who perform activities of daily living well (parent survey)
2. Percentage of youth who usually got together with friends outside of school at least weekly in the past year (youth survey)
3. Percentage of youth who participated in a school sport or club in the past year (youth survey)
4. Percentage of youth who have received an out-of-school suspension (parent survey)
5. Percentage of youth who have taken a college entrance or placement test (youth survey)
6. Percentage of youth who have had paid work experience in the past year (youth survey)
7. Percentage of parents who expect their child to be living independently by age 30 (parent survey)

For each of these measures, the study calculated the design effect and square root of the design effect separately for 17 disability groups of youth (all youth, all youth with an IEP, youth within each of the 12 IDEA disability groups, all youth without an IEP, youth with a 504 plan but no IEP, and youth with neither a 504 plan nor an IEP.

Table 20 reports the average design effect and the average root design effect across the seven measure for each group of youth. Appendix D provides the design effects and root design effects for each measure and group.

Table 20. Average design effects and root design effects, by disability group

| Disability group | Average design effect | Average root design effect |
| :---: | :---: | :---: |
| All youth | 7.65 | 2.76 |
| IEP | 3.32 | 1.82 |
| Autism | 1.27 | 1.13 |
| Deaf-blindness | 2.99 | 1.71 |
| Emotional disability | 1.47 | 1.21 |
| Hearing impairment | 1.45 | 1.20 |
| Intellectual disability | 1.66 | 1.28 |
| Multiple disabilities | 2.04 | 1.42 |
| Orthopedic impairment | 1.91 | 1.36 |
| Other health impairment | 1.41 | 1.18 |
| Specific learning disability | 1.45 | 1.20 |
| Speech or language impairment | 1.70 | 1.30 |
| Traumatic brain injury | 1.96 | 1.38 |
| Visual impairment | 1.44 | 1.20 |
| No IEP | 2.00 | 1.41 |
| 504 plan but no IEP | 1.91 | 1.38 |
| Neither 504 plan nor IEP | 1.52 | 1.23 |

Note: The formula for the design effect is provided in equation 6.2. The root design effect is the square root of the design effect. The average design effect and root design effect are based on seven key indicators that are linked with post-high school outcomes from Volume 2 . See appendix $D$ for more detail on design effects for these seven measures.

## Chapter 7. Analysis of the potential for unit-level nonresponse bias

Addressing the potential for bias caused by nonresponse has become more important over the past decade because of the downward trend in response rates to surveys. Although low unit response rates do not necessarily increase nonresponse bias, they do create the potential for such bias (Groves, 2006). The National Center for Education Statistics (NCES) Statistical Standards specify that a nonresponse bias analysis be conducted whenever unit response at any stage of sample selection is less than 85 percent (Standard 4-4-1).

This chapter presents the findings from an analysis of the potential for nonresponse bias in the National Longitudinal Transition Study 2012 (NLTS 2012) parent and youth surveys. As described in chapter 3, sampled youth were selected in two stages: districts were selected first, then youth in participating districts. The NLTS 2012 study obtained first-stage participation of 76 percent of districts selected. Among participating districts, response rates on the parent and youth surveys were approximately 60 and 50 percent, respectively, across youth disability groups (see chapter 4).

This chapter focuses on unit-level nonresponse at the second stage of sample selection (participation of parents and youth in the surveys), although section B includes an analysis of unit-level nonresponse at the first stage (district participation).

## A. Summary of three unit-level nonresponse bias analyses

The study used three methods to assess the potential for unit-level nonresponse bias, described in the list that follows. Together, these methods suggested that the nonresponse adjustments to the weights described in chapter 6 succeeded in limiting the potential for bias.

1. Using administrative data to examine and adjust for nonparticipation of districts and nonresponse to the surveys. This approach, discussed in section B, assessed whether nonresponse adjustments to the sampling weights achieved the goal of reducing differences between participants and the full sample on measures available from administrative records for the full sample. The study conducted this analysis both at the district level and at the youth level. At the district level, there were no statistically significant differences between participating and nonparticipating districts on any of the measures examined, either before or after adjustments to the district sampling weights. At the youth level, the nonresponse adjustments to the youth sampling weights substantially reduced the number of differences between respondents and the full sample. The proportion of variables where a statistically significant difference remained was no larger than what would be expected by chance.
2. Conducting a follow-up survey of nonrespondents to compare parent survey respondents to the full sample on some survey measures. This approach, discussed in section C, involved conducting a short survey to secure responses to selected survey items from a subsample of parents who had not responded to the NLTS 2012 parent survey. This Nonrespondent Follow-Up Survey (NFS) provided a basis for comparing parent survey respondents to the full sample, including respondents and nonrespondents. The analysis of the NFS pointed to one variable with the greatest potential for bias-the age at which youth first received special education services. Specifically, parent survey respondents appeared to be more likely than nonrespondents to report that their child first received special education at a younger age. The NFS suggested
other smaller differences between respondents and nonrespondents in variables that might be correlated with reduced likelihood of receiving special education services before age 8 .
3. Generating an alternative set of weights using responses from the NFS as a sensitivity analysis to gauge whether potential bias in the age youth first received services could appreciably affect the NLTS 2012 report findings. This approach, discussed in section D, examined how the potential bias in the age at which youth first receive special education services may have affected the measures and intergroup comparisons presented in the NLTS 2012 Volume 1 and 2 reports (Lipscomb et al., 2017a, 2017b). The respondent sample was reweighted so that the distribution of age at which youth first received special education was the same in the respondent sample as in the combined NFS and respondent samples. The analyses in Volumes 1 and 2 were then conducted again and the results compared with those reported in the two volumes. The NFS-reweighted sensitivity analysis indicated that this potential source of nonresponse bias does not appreciably affect the main findings in Volumes 1 and 2. While the sensitivity analysis did not specifically examine the Volume 3 findings, that volume includes a subset of the variables covered in Volumes 1 and 2; hence the results are likely to apply to that volume as well.

The next three sections of this chapter provide more detail on these three lines of analysis respectively.
B. Using administrative data to examine and adjust for nonparticipation of districts and nonresponse to the surveys

This nonresponse bias analysis uses administrative data that are available for the full sample to examine and adjust for nonparticipation among districts and nonresponse to the surveys. The methods are described first, and then applied to assess the potential for bias at both the district level and at the parent- or youth-survey level. In the context of the district-level analysis, the term nonresponse refers to district nonparticipation.

## 1. Methods for evaluating nonresponse bias

Both the district-level analysis and the youth-level analysis rely on two estimates of bias-one that does not include any nonresponse adjustments to the weights and another that includes nonresponse-adjusted weights. The analyses assess the extent to which the nonresponse-adjusted weights reduce the potential for bias among participating districts and among survey respondents, making the findings more representative. The methods follow those implemented for NCES surveys, particularly the High School Longitudinal Survey (HSLS). ${ }^{16}$

Nonresponse bias, $B(\bar{\theta})$, is the difference between a sample mean and the true population mean:
(7.1) $B(\bar{\theta})=\bar{\theta}-\mu$
where $\bar{\theta}$ is the mean estimated from a sample and $\mu$ is the true population mean.

[^11]An alternative measure of nonresponse bias, called relative bias, standardizes bias relative to the population mean. The equation for relative bias is:
(7.2) $R(\bar{\theta})=\frac{\bar{\theta}-\mu}{\mu}$

These expressions were used to calculate the bias estimates, described in the following discussion, which appear in tables 21 and 22, and in appendix E.

Estimate of bias before nonresponse adjustments. The first estimate of bias is a comparison of the sample mean among respondents ( $\boldsymbol{\theta}=\overline{\boldsymbol{y}}_{R}$ ) to the sample mean among respondents and nonrespondents prior to making any nonresponse adjustments. The sample means use the base youth sampling weights that account for the probability of selection into the sample. This measure of bias is equal to the nonresponse rate times the difference between the means for respondents and nonrespondents (or between participants and nonparticipants in the case of the district-level analysis). To show this measure, first note that the population mean can be estimated as:
(7.3) $\hat{\mu}=(1-\hat{\eta}) \bar{y}_{R}+\hat{\eta} \bar{y}_{N R}$,
where $\hat{\eta}$ is the weighted unit nonresponse rate, and $\bar{y}_{N R}$ is the mean estimated from nonrespondents. Substituting this equation into (7.1), nonresponse bias can be estimated as:

$$
\begin{align*}
\hat{B}\left(\bar{y}_{R}\right) & =\bar{y}_{R}-\left[(1-\hat{\eta}) \bar{y}_{R}+\hat{\eta} \bar{y}_{N R}\right] \\
& =\bar{y}_{R}-\bar{y}_{R}+\hat{\eta} \bar{y}_{R}-\hat{\eta} \bar{y}_{N R}  \tag{7.4}\\
& =\hat{\eta} \bar{y}_{R}-\hat{\eta} \bar{y}_{N R} \\
& =\hat{\eta}\left(\bar{y}_{R}-\bar{y}_{N R}\right)
\end{align*}
$$

Based on the measure of bias, relative bias can be calculated as follows.
(7.5) $\hat{R}\left(\bar{y}_{R}\right)=\frac{\hat{B}\left(\bar{y}_{R}\right)}{\hat{\mu}}=\frac{\hat{\eta}\left(\bar{y}_{R}-\bar{y}_{N R}\right)}{(1-\hat{\eta}) \bar{y}_{R}+\hat{\eta} \bar{y}_{N R}}$

Estimate of bias after nonresponse adjustments. The second estimate of bias is a comparison of the sample mean among respondents after making nonresponse adjustments $\left(\boldsymbol{\theta}=\bar{y}_{A}\right)$ to the same (unadjusted) sample mean among respondents and nonrespondents from the first measure. That is, estimated bias equals:

$$
\begin{align*}
\hat{B}\left(\bar{y}_{A}\right) & =\bar{y}_{A}-\hat{\mu}  \tag{7.6}\\
& =\bar{y}_{A}-(1-\hat{\eta}) \bar{y}_{R}+\hat{\eta} \bar{y}_{N R}
\end{align*}
$$

And, the measure of relative bias is:
(7.7) $\hat{R}\left(\bar{y}_{A}\right)=\frac{\hat{B}\left(\bar{y}_{A}\right)}{\hat{\mu}}=\frac{\bar{y}_{A}-\left[(1-\hat{\eta}) \bar{y}_{R}+\hat{\eta} \bar{y}_{N R}\right]}{(1-\hat{\eta}) \bar{y}_{R}+\hat{\eta} \bar{y}_{N R}}$

## 2. The potential for district-level unit nonresponse bias

This section applies the methods described above to the analysis of district-level nonresponse bias. The analysis focuses on the following district-level data characteristics drawn from the Common Core of Data (CCD):

- District sampling stratum (small, medium-sized, and large district units, and special schools)
- Geographic region (using the four Census regions)
- Degree of urbanicity (using the District Urban-Centric Locale Code from the CCD)
- Number of students grade-eligible for the study (enrolled in grades 7 to 12 )
- Percentage of students with an individualized education program (IEP)
- Percentage of students who were classified as white and not Hispanic or Latino
- Percentage of students who were classified as black or African American and not Hispanic or Latino
- Percentage of students who were classified as Hispanic or Latino
- Percentage of students who were classified as eligible for free lunch
- Percentage of students who were classified as eligible for reduced-price lunch
- Percentage of students who were classified as eligible for free or reduced-price lunch

The results of this nonresponse bias analysis indicate that the potential for bias at the district level is low both before and after the adjustments for district nonparticipation were applied to the weights. There were no statistically significant differences between either (1) the characteristics of the student population in participating and nonparticipating districts before adjusting base district weights, or (2) the characteristics of youth in participating districts and the student population in the full sample after the adjustments were applied. Table 21 shows these comparisons.

Examining the first row of table 21 provides an example of how to interpret the table entries. When using the base district weights before adjustment for nonparticipation, the percentage of students in small districts is 63.5 percent for the total sample, 62.8 percent for participating districts, and 66.0 percent for nonparticipating districts. The estimated bias in the percentage of student population in small districts is -0.8 percentage points. This figure is the difference between 62.8 and 66.0 percent ( -3.2 percent) multiplied by the nonparticipation rate of 0.24 (see equation 7.4). The relative bias is the estimated bias expressed as a percentage of the estimate for the full population. In this case, the relative bias for the percentage of students in small districts is -1.2 percent.

The estimated bias after weight adjustment for district nonparticipation ( -2.1 percentage points) is the difference between the estimate using participating districts after the weight adjustments ( 61.4 percent) and the estimate using the full sample ( 63.5 percent). Relative bias after weight adjustment for nonparticipating districts is calculated as estimated bias after adjustment divided by the estimate for the full sample ( -3.3 percent).

## Table 21. District unit nonresponse bias before and after adjustments to the base district weight

| District characteristics | Before adjustments for district nonparticipation (base district weight ${ }^{1}$ ) |  |  |  |  |  | After adjustments for district nonparticipation (nonresponse-adjusted district weight ${ }^{2}$ ) |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

${ }^{1}$ The base district weight is the sampling weight for each district in the sample and is poststratified to population counts of students, both those with an IEP and those without an IEP.
${ }^{2}$ The nonresponse-adjusted district weight adjusts the base district weight for district nonresponse and is poststratified to population counts of students, both those with an IEP and those without an IEP.
${ }^{3}$ Estimated bias is calculated as the weighted nonresponse rate times the difference in the weighted responding and nonresponding district sample percent. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
${ }^{4}$ The relative bias is calculated as the estimated bias divided by the (before adjustments) overall percent of row characteristics.
${ }^{5}$ Estimated bias is calculated as the difference in the weighted overall percent before and after the adjustments for nonresponse. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
${ }^{6}$ Small districts contained an estimated 30-199 age-eligible students with an IEP. Medium-sized districts contained an estimated 200-374 age-eligible students with an IEP. Large districts contained an estimated 375 or more age-eligible students with an IEP. The estimated age-eligible IEP student counts were developed from 2008-2009 Common Core of Data from the U.S. Department of Education's National Center for Education Statistics. Special schools are state-sponsored special schools serving students who are blind or deaf.
${ }^{7}$ City areas are the territories inside urbanized areas and inside principal cities. Suburb areas are the territories outside principal cities and inside urbanized areas. Town areas are the territories inside urban clusters but outside urbanized areas. Rural areas are the Census-defined rural territories outside of urbanized areas as well as urban clusters.

## 3. The potential for youth-level nonresponse bias

This nonresponse bias analysis at the youth level used administrative data at the district, school, and youth levels to define 87 subgroups of youth. For each subgroup, the study first compared the percentages of responding and nonresponding parents and youth before nonresponse adjustments (that is, using the base youth weights). The study then compared the percentages of responding parents and youth with the full samples (respondents and nonrespondents) after nonresponse weighting adjustments. The nonresponse-adjusted weights used were the all youth weights described in chapter 6 (restricted-use data file variables p_weight_allyouth and y_weight_allyouth).

Separate nonresponse bias analyses were completed for 17 groups defined by the youth's disability status: all youth, youth with an IEP, youth without an IEP, youth in the 12 IDEA disability groups, youth with a 504 plan but no IEP, and youth with neither a 504 plan nor an IEP. In total, 1,479 nonresponse bias estimates were calculated per survey ( 87 subgroups multiplied by 17 disability groups) before and after adjustment of the weights for youth-level nonresponse.

The results of this analysis for both the parent and youth survey data indicate that the nonresponse adjustments reduced the incidence of statistically significant differences between the full sample and respondents to a level expected only by chance. Overall, the difference between the estimates for the full sample and the nonresponseadjusted estimates for responding parents or youth are statistically significant for about 3 percent of bias estimates across all measures available for respondents and nonrespondents and the 17 disability groups.

The discussion that follows first describes the detailed results for a representative set of the findings-those for all youth with an IEP from the parent survey-and then summarizes the findings across disability groups and surveys. Appendix E presents the detailed results for all the disability groups and for each survey.

Detailed results for all youth with an IEP from the parent survey. The parent survey results for all youth with an IEP are shown in table 22. To clarify how to interpret the table, the following discussion summarizes the results in the first row, which pertains to the percentage of youth in small districts:

- Bias before nonresponse adjustment for all youth with an IEP. The weighted percentage of youth in districts selected from the stratum of small districts is 20.6 percent for the total sample, 21.4 percent for respondents, and 19.3 percent for nonrespondents. The estimated bias in the percentage of student population in small districts is 0.8 percentage points, which is the product of the nonresponse rate of 0.404 and the difference between 21.4 and 19.3 percent. The estimated bias in this example is not statistically significant. The relative bias is the estimated bias divided by the full sample mean, or 4.1 percent.
- Bias after nonresponse adjustment for all youth with an IEP. Following nonresponse adjustment, the estimated bias ( -0.3 percentage points) is less than half as large in absolute value and continues to not be statistically significant. The relative bias after adjustment is -1.5 percent.

Across the 87 subgroups formed by district, school, and youth characteristics, the bias after nonresponse adjustment for the group of all youth with an IEP is statistically significant in four instances, or 4.6 percent of the comparisons in the parent survey. This result is no larger than the expected proportion of statistically significant differences due to chance ( 5 percent).

## Table 22. Parent survey unit nonresponse bias before and after adjustments to the base youth weight: youth with an IEP

Summary of results by disability group and survey. For nearly all disability groups in each survey, the nonresponse adjustment reduces the number of statistically significant differences to a number that would be expected by chance (table 23). In particular:

- Parent survey estimates of the potential for bias by disability group. Nonresponse adjustments to the parent survey weights reduced the proportion of statistically significant bias estimates from 19 to 3 percent. The number of statistically significant bias estimates after adjustment ranged from zero for youth with autism, deaf-blindness, hearing impairments, or traumatic brain injuries to eight for youth with a 504 plan. Youth with a 504 plan but no IEP were the only group for which the number of statistically significant bias estimates exceeded the four to five expected by chance.
- Youth survey estimates of the potential for bias by disability group. Nonresponse adjustments to the youth survey weights reduced the proportion of statistically significant bias estimates from 18 to 3 percent. The number of statistically significant bias estimates after adjustment ranged from zero for youth with hearing impairments, orthopedic impairments, or other health impairments to nine for youth with speech or language impairments. It exceeded the four to five expected by chance for all youth with an IEP and for youth with speech or language impairments (six and nine statistically significant bias estimates, respectively).

Table 23. Summary of the reduction in the potential for youth-level nonresponse bias in the parent and youth surveys based on nonresponse adjustments to the weights

| Disability group | Number of statistically significant bias estimates |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Parent survey |  | Youth survey |  |
|  | Before nonresponse adjustment | After nonresponse adjustment | Before nonresponse adjustment | After nonresponse adjustment |
| Total for all 17 disability groups | 280 (18.9\%) | 37 (2.5\%) | 265 (17.9\%) | 41 (2.8\%) |
| All youth | 22 | 2 | 23 | 2 |
| IEP | 28 | 4 | 31 | 6 |
| Autism | 20 | 0 | 15 | 5 |
| Deaf-blindness | 2 | 3 | 3 | 3 |
| Emotional disturbance | 26 | 1 | 27 | 1 |
| Hearing impairment | 7 | 0 | 7 | 0 |
| Intellectual disability | 15 | 3 | 18 | 1 |
| Multiple disabilities | 19 | 4 | 15 | 3 |
| Orthopedic impairment | 23 | 4 | 15 | 0 |
| Other health impairment | 17 | 1 | 9 | 0 |
| Specific learning disability | 21 | 1 | 23 | 2 |
| Speech or language impairment | 19 | 2 | 19 | 9 |
| Traumatic brain injury | 4 | 0 | 4 | 1 |
| Visual impairment | 3 | 2 | 6 | 2 |
| No IEP | 23 | 1 | 23 | 1 |
| 504 plan but no IEP | 10 | 8 | 6 | 4 |
| Neither 504 plan nor IEP | 21 | 1 | 21 | 1 |

Note: The findings for each disability group are based on bias estimates calculated for 87 subgroups given by district, school, and youth characteristics (1,479 total bias estimates across the 17 disability groups). These counts are aggregated from statistics in table 22 and those in appendix E.

## C. Nonrespondent Follow-Up Survey

The NLTS 2012 Nonrespondent Follow-Up Survey (NFS) provided an additional method to analyze the potential for unit-level nonresponse bias in the parent and youth surveys. Conducted in summer 2013, the NFS targeted a sample of parents who had not responded to the parent survey by June 2013. It was designed to compare youth whose parent had responded to the parent survey with those whose parent had not responded.

## 1. Survey design and implementation

The goal of the NFS was to survey parents who had not responded to the NLTS 2012 parent survey to determine whether their children had different characteristics or experiences, on average, than those of youth whose parents had responded. Obtaining responses to the NFS would be challenging because the NFS sample was parents who had already not responded to the parent survey. Several survey modes had already been used on the parent survey to try to secure a response, including computer-assisted telephone interviewing in 2012 and a combination of web survey with decentralized in-person follow-up by field interviews in 2013. It was not possible to add a new survey mode to elicit a response from those who were reluctant to participate.

The strategy for the NFS was to focus only on parents and condense the parent survey instrument to a short 5 minute survey covering a subset of key characteristics and experiences. By keeping the survey short, the NFS was designed to make it easy for parents to respond. To efficiently reach parents, the NFS sample was restricted to public school districts and charter schools operating as school districts in large and medium-size district sampling units. Students selected from the small district unit stratum and from state-sponsored special schools were not included in the NFS sampling frame.

The NFS sample was designed to support separate analysis of two groups: all youth with an IEP and all youth without an IEP. Table 24 shows the number of NLTS 2012 parent survey nonrespondents by disability group who were selected for and completed the NFS. The response rate was 45 percent overall, 45 percent among parents of sampled youth with an IEP, and 43 percent among parents of sampled youth without an IEP.

Table 24. Nonrespondent Follow-Up Survey: Number of parents selected, number of respondents, and response rate, by disability group

| Disability group | Number of parent survey <br> nonrespondents selected for the NFS | Number of respondents <br> to the NFS | Unweighted response <br> rate (percentage) |
| :--- | ---: | ---: | ---: |
| Total sample (all youth) | $\mathbf{1 , 6 5 8}$ | 737 | 44.5 |
| IEP | $\mathbf{1 , 3 8 6}$ | 621 | 44.8 |
| Autism | 143 | 66 | 46.2 |
| Emotional disturbance | 146 | 56 | 38.4 |
| Intellectual disability | 198 | 98 | 49.5 |
| Multiple disabilities | 169 | 71 | 42.0 |
| Other health impairment | 185 | 96 | 51.9 |
| Specific learning disability | 198 | 83 | 41.9 |
| Speech or language impairment | 170 | 74 | 43.5 |
| Less prevalent disability groups ${ }^{1}$ | 177 | 77 | 43.5 |
| No IEP | $\mathbf{2 7 2}$ | $\mathbf{1 1 6}$ | $\mathbf{4 2 . 6}$ |

${ }^{1}$ The NFS combined youth with deaf-blindness, hearing impairments, orthopedic impairments, traumatic brain injuries, and visual impairments.
Source: National Longitudinal Transition Study 2012.

## 2. Method for evaluating nonresponse bias

The NFS analysis assessed the potential for youth-level nonresponse bias using the measures of estimated bias described in section B. Specifically, the study first compared NLTS 2012 parent survey respondents with nonrespondents who had completed the NFS. Base weights (the inverse of each sample member's probability of selection) were used to calculate estimates for parent survey respondents. A set of nonresponse-adjusted weights were developed for the parent survey nonrespondents who completed the NFS, so that weighted estimates for that group could generalize to the population of all those who did not respond to the parent survey.

The study then compared NLTS 2012 parent survey respondents using the nonresponse-adjusted weights and the full sample (defined to include parent survey respondents plus nonrespondents who completed the NFS). The nonresponse-adjusted weights used were the all youth weights described in chapter 6 (restricted-use data file variable p_weight_allyouth and y_weight_allyouth). To assess the statistical significance of the difference between each pair of estimates, the study generated $t$-test statistics for binary variables and chi-square test statistics for multilevel categorical variables. ${ }^{17}$

Differences between the parent survey and the much shorter NFS may make it harder to interpret or rely on comparisons between the two. In particular:

- The survey questions differed for some topics. Respondents to the parent survey were asked several times in different ways whether their child had a disability or received special education services, but the NFS asked a single question about whether the child had ever received special education services. ${ }^{18}$ Similarly, the respondents in the parent survey were asked separate questions about current enrollment in school and receipt of instruction in other settings, but these questions were simplified and consolidated for the NFS. Finally, there were several opportunities in the main survey to report that a youth transition planning meeting had occurred and these were consolidated to a single item in the NFS.
- The periods during which the surveys were administered and the reference periods covered by the survey differed. Survey respondents in spring and summer 2012 were asked to report on school experiences in school year 2011-2012, and respondents in spring and summer 2013 reported on school year 2012-2013. Approximately half of NLTS 2012 respondents completed the survey in each year. In contrast, all NFS respondents completed the survey in summer 2013 and reported on school year 2012-2013. Therefore, on average, the NFS respondents have older children than the main respondent sample, and their children are thus further along in their transition from school. This sample also includes a larger proportion of youth
${ }^{17}$ The comparisons between the response-adjusted estimates of parent survey respondents and respondents plus nonrespondents are tests to determine whether the confidence intervals of two estimates overlap. One of the groups being compared (respondents to the parent survey) is a subgroup of the other group being compared in the test (respondents to the parent survey plus respondents to the NFS). The code to conduct these tests in SAS-SUDAAN is similar to box 2, except that the data are stacked (observations for parent survey respondents stacked on top of observations for parent survey respondents plus nonrespondents who completed the NFS) and the CONTRAST option is specified within the PROC DESCRIPT command.
${ }^{18}$ In both surveys, parents who indicated their child had received special education services were also asked when they first received these services.
who have left high school. To facilitate comparisons that control for these differences, separate estimates are presented for the parent sample who responded in 2012 and for those who responded in 2013.

## 3. The potential for youth-level nonresponse bias

The most serious potential for nonresponse bias suggested by the NFS analysis is the age at which youth with an IEP first received special education services. For youth with an IEP, nonrespondents to the parent survey were less likely than respondents to report their child had first received special education services before age 8 , as opposed to age 8 or later, or that they never received services. For youth without an IEP, several differences between respondents and nonrespondents were statistically significant, but none was large enough or affected a large enough proportion of the population to raise similar concerns about the potential for nonresponse bias across a broad range of study estimates.

This section describes the findings for youth with an IEP in detail and then summarizes the findings for youth without an IEP. The description of each set of findings first discusses any differences between parent survey respondents and nonrespondents who completed the NFS, and then discusses differences between respondents and the full sample.

## 3a. Findings for youth with an IEP

Differences between parent survey respondents and the nonrespondents who completed the NFS. The analysis revealed several statistically significant differences between parent respondents and nonrespondents of youth with an IEP (table 25):

- The largest, and potentially most important, difference was that nonrespondents were less likely than respondents to report their child first received special education services before age 8. ${ }^{19}$ Thirty percent of nonrespondents reported their child received special education services before age 8 , compared with 48 percent of respondents, a difference of 18 percentage points. Consistent with this finding, nonrespondents were more likely to report their child first received special education services at age 8 or later ( 59 versus 48 percent) or never received these services ( 10 versus 4 percent).
- Nonrespondents were more likely than respondents to report their child had greater abilities to perform activities of daily living. Specifically, 44 percent of nonrespondents, compared to 33 percent of respondents, indicated their child's daily living abilities were in the high range.
- Nonrespondents were more likely than respondents to expect their child will complete trade school or two years of college ( 40 versus 28 percent). Smaller percentages of nonrespondents believed that their child would, at most, obtain a high school credential or not obtain a high school diploma ( 33 versus 39 percent) or that their child would complete a four-year college degree or higher ( 27 versus 34 percent).
- Children of nonrespondents were more likely than children of respondents to live with a parent or guardian at least part of the school year, although the difference is small ( 96 versus 94 percent).

[^12]- Respondents and nonrespondents differed on several measures of their children's school enrollment status, but this difference was driven by differences in survey timing rather than by differences in the experiences of same-age youth in the two groups. Because they were a year older, children of nonrespondents were less likely than children of respondents to be enrolled in school ( 81 versus 91 percent). Among those enrolled, children of nonrespondents were less likely to be in grade 8 or lower grades ( 15 versus 27 percent). However, for each of these measures, the differences between nonrespondents and respondents in 2013 were smaller: 81 percent of nonrespondents and 83 percent of respondents had children who were enrolled; 15 percent of nonrespondents and 19 percent of respondents had children in grade 8 or lower.
- Nonrespondents were more likely than respondents to report participating in a transition-planning meeting for their child. Federal guidance specifies that, by age 16, a transition plan be developed for each youth with an IEP to guide course selections and other preparations for leaving school. Approximately 84 percent of parent nonrespondents with children age 16 or older who were currently receiving special education services reported participating in a meeting with school staff to help youth make plans for what they would do after high school, compared with 60 percent of all respondents and 62 percent of 2013 respondents. The difference is difficult to interpret because of differences in the two surveys, which affect both the numerator and denominator of the estimated percentage of parents participating in a transition meeting for their child.

There were no statistically significant differences between NLTS 2012 parent survey respondents and nonrespondents on six measures of youth characteristics, family status, and educational experience:

1. Youth's health is fair, poor, or good.
2. Respondent is sample member's parent.
3. Responding parent's highest level of education.
4. Parent has a paid job.
5. Youth ever repeated a grade.
6. Youth currently receiving special education services (among youth enrolled in school).

Differences between parent survey respondents and the full sample. Forty-seven percent of NLTS 2012 parent survey respondents reported that their child first received special education services before age 8 , compared with 41 percent for the full sample (combining parent survey respondents and nonrespondents who completed the NFS), a difference of 6 percentage points (table 25). Because youth receiving special education services early may have different capabilities, experiences, and expectations for the future when they reach transition age, this difference in age at which youth first received special education services is a significant source of potential nonresponse bias in the NLTS 2012 parent survey.

There were a few other statistically significant differences between the estimates for the full sample and the parent respondent sample. Relative to children of respondents, the full sample of youth appears to be more likely to:

- Have functional skills scale scores in the high range ( 37 versus 34 percent, a difference of 3 percentage points)
- Live with a parent during the current school year ( 95 versus 94 percent, a difference of 1 percentage point)
- Have a parent who expected the youth will complete trade school or two years of college ( 33 versus 28 percent, a difference of 5 percentage points) with a corresponding lower percentage of the full sample expecting the youth to complete four-year college ( 31 versus 34 percent, a difference of 3 percentage points)
- Have a parent or other adult household member who attended a transition meeting ( 69 versus 59 percent, a difference of 10 percentage points)

In addition, youth in the full sample were less likely than youth of parent survey respondents to be:

- Enrolled in school in the survey school year ( 87 versus 90 percent, a difference of 3 percentage points)
- In grade 8 or lower, if enrolled ( 23 versus 26 percent, a difference of 3 percentage points)

## 3b. Findings for youth without an IEP

Differences between respondents to the NLTS 2012 parent survey and nonrespondents who completed the NSF. For youth without an IEP, there were fewer statistically significant differences between nonrespondents and respondents (table 26). Nonresponding parents were more likely to assess their child's ability to perform three everyday tasks in the low range of a simple functional abilities scale, and they were less likely to expect their child would attain 4 or more years of college:

- Fourteen percent of nonrespondents provided an assessment of the youth's functional skills that placed the youth in the low category, compared to 6 percent of respondents, a difference of 9 percentage points.
- Fifty-eight percent of nonrespondents expected their youth to attain at least a four-year college degree, compared to 75 percent of respondents, a difference of 17 percentage points. In addition, 33 percent expected their child to complete trade school or a two-year college degree, compared with 15 percent of respondents, a difference of 18 percentage points.

Other differences between nonrespondents and respondents among youth without an IEP were generally small, and none was statistically significant.

Differences between full sample and respondents. There were fewer and smaller differences between the full sample and respondents among youth without an IEP than was the case for youth with an IEP. There were small, but statistically significant, differences on the functional abilities scale:

- Nine percent of the full sample was in the low range of the functional abilities scale, compared to 5 percent of the respondent sample, a difference of 4 percentage points.
- Sixty-eight percent of the full sample expected their youth to attain 4 or more years of college, compared to 75 percent of the respondent sample, a difference of 7 percentage points.

## Table 25. Estimates of key survey measures for NLTS 2012 parent survey respondents and nonrespondents who completed the NFS: Youth with

 an IEP in medium-sized and large primary sampling units| Survey measure | NLTS 2012 parent survey respondent sample (base weights) | Nonrespondent Follow-Up Survey (nonresponseadjusted weights) | NLTS 2012 parent survey respondent sample in 2012 (base weights) | NLTS 2012 parent survey respondent sample in 2013 (base weights) | Combined respondent plus nonrespondent sample (nonresponse-adjusted weights) | NLTS 2012 parent survey respondent sample (nonresponseadjusted weights) |

## D. How potential nonresponse bias affects the NLTS 2012 findings

The findings from comparing the NLTS 2012 parent survey respondents and the nonrespondents who completed the NFS suggest the potential for nonresponse bias in the analysis of the parent and youth surveys. Specifically, the apparent overrepresentation of youth with an IEP receiving special education services before age 8 could generate biased findings.

The study conducted an NFS-reweighted sensitivity analysis to assess the potential extent of this bias. A new set of weights were developed to reflect the estimated distribution of ages when the full sample first received special education services, drawing on both the NLTS 2012 parent survey and the NFS. The NFS-reweighted sensitivity analysis used these weights instead of the study analytic weights to re-estimate group means for all the parent and youth survey variables contained in Volumes 1 and 2. The study then compared the NFSreweighted estimates with those presented in Volumes 1 and 2 to assess the robustness of the findings in each volume. ${ }^{20}$ The NFS-reweighted sensitivity analysis did not examine estimates in Volume 3 but the findings reported in this discussion nevertheless apply broadly to that volume as well because nearly all the variables analyzed in that volume are drawn from Volumes 1 and 2.

The findings from the NFS-reweighted sensitivity analysis indicate that the potential bias associated with the age when youth first received special education services changes few of the estimates presented in Volumes 1 and 2, and would not appreciably alter key conclusions. The main findings, which are discussed further in the text that follows, are as follows:

- Nearly all NFS-reweighted sensitivity estimates differed from those in Volumes 1 and 2 only by small amounts. In each volume, 95 percent of estimates changed by at most 1 percentage point.
- Nearly all of the main tests of statistical significance reported in Volumes 1 and 2 are unchanged using the NFS-reweighted estimates. For Volume 1, only 2 percent of the approximately 1,200 between-group hypothesis tests changed in the sensitivity analysis from statistically significant to not statistically significant or vice versa. For Volume 2, only 3 percent of approximately 1,900 between-group hypothesis tests changed in terms of statistical significance.
- None of the key conclusions in Volumes 1 and 2 were affected. The changes in point estimates did not materially affect the highest-level study conclusions presented in the executive summaries of Volumes 1 and 2 of the NLTS 2012 report.

The rest of this section presents additional detail on the methods and findings.

## 1. Method for evaluating nonresponse bias

The first step to determine how overrepresentation of youth with an IEP who receive services before age 8 might affect study findings was creating a new set of weights that incorporated information from the NFS. These weights adjusted the study's enrolled youth weights (see chapter 6) so that the distribution of ages when youth first receive special education services among the weighted NLTS 2012 respondent sample enrolled in

[^13]school matched that of the full sample, estimated by combining the nonrespondent data from the NFS with the respondent data from the NLTS 2012 parent survey. The NFS-reweighted sensitivity analysis included only youth whose parent reported they were enrolled in an educational program during the school year covered by the survey to maintain the same sample that was used in the analyses for Volumes 1 and 2 (in contrast to the nonresponse bias analyses described earlier in this chapter, which included youth who were and were not enrolled in school the year of the survey).

The weighting adjustments based on the NFS were made only for sample members with an IEP according to the school district. Specifically, among sampled youth whose district reported they had an IEP, three groups were formed, separately for both parents and youth respondents: (1) youth whose parents reported the student first received special education before age 8 , (2) those who first received special education at age 8 or older, and (3) those whose parent reported the youth never received special education. The enrolled youth weights were then modified so they had the same weighted distribution across these three groups as the combined sample of NLTS 2012 parent survey respondents and the NFS respondents.

Next, the study used the sensitivity analysis weights to recalculate all point estimates and standard errors presented in the NLTS 2012 report, Volumes 1 and 2. Finally, the new estimates were compared with the report estimates to assess the size and statistical significance of the differences.

The validity of this approach relies on two important assumptions:

- The weighted data from respondents to the NFS accurately reflect the distribution of all nonrespondents to the NLTS 2012 parent survey in terms of the age when youth first received special education services. However, the NFS may not be representative of all NLTS 2012 parent survey nonrespondents because it was limited to the strata of medium-sized and large district units, and it had a parent response rate of approximately 40 percent.
- The effects of any potential for nonresponse bias in the estimates in the NLTS 2012 report can be addressed by realigning the weighted distributions of parents and youth based on the variable capturing when youth first received special education services. In other words, the analysis assumes that the characteristics and experiences of respondents in each category of age-at-first-IEP are representative of the nonrespondents in the corresponding category.

The study did not use separate adjustment factors for individual IDEA disability groups because doing so would have increased the variance of the estimates, given the limited sample sizes in the NFS. The value for the adjustment factor was heavily influenced by the results for students in 4 of the 12 IDEA disability categories, which together represent more than 80 percent of students with an IEP. These four IDEA disability categories are specific learning disability ( 51 percent), other health impairment ( 14 percent), and intellectual disability and emotional disturbance (each around 9 percent). This approach reduced the variation in the sensitivity analysis weights and potentially increased the precision for the reweighted estimates for all youth with an IEP. However, this approach might make the reweighted estimates for some IDEA disability groups less accurate.

For the parent survey, the NFS-reweighted sensitivity weights reduced the average weight for parents of youth who first received special education before age 8 and increased the average weight for parents of youth identified later or never (table 27, columns 1 and 2). Columns 3 and 4 show the approximate percentage change in the average weight of each group based on age at first receipt of special education due to the
addition of the NFS respondents, and the weight adjustment factor. For example, including NFS respondents reduced the average weight for youth who first received special education services before age 8 by 11.8 percent. Including these respondents increased the average weights for youth who first received special education services at age 8 or never by 6.5 and 65.0 percent, respectively.

Table 27. Average weight and adjustment factors based on parent report of age at which youth first received special education, for youth with an IEP and enrolled in school during the year of interview

| Variable | Average weight |  | Change in average weight (percentage) | Weight adjustment factor |
| :---: | :---: | :---: | :---: | :---: |
|  | NLTS 2012 parent survey respondents ${ }^{1}$ (percentage) | Combined NLTS 2012 parent survey respondents and NFS respondents ${ }^{2}$ (percentage) |  |  |
| Parent survey |  |  |  |  |
| Before age 8 | 48.0 | 42.3 | -11.8 | 0.882 |
| Age 8 or older | 48.2 | 51.3 | +6.5 | 1.065 |
| Youth never received special education services | 3.9 | 6.4 | +65.0 | 1.650 |
| Youth survey |  |  |  |  |
| Before age 8 (based on parent report) | 47.7 | 48.5 | +1.7 | 1.017 |
| Age 8 or older | 48.3 | 47.7 | -1.3 | . 987 |
| Youth never received special education services | 4.0 | 3.9 | -4.0 | . 960 |

${ }^{1}$ The estimates are computed using the nonresponse-adjusted weights for survey respondents (that is, the enrolled youth weights).
2 The estimates for the combined NLTS 2012 parent survey respondents and the NFS respondents are computed using the unadjusted weights for NLTS 2012 parent survey respondents and the nonresponse-adjusted weights for the NFS respondents.

Source: National Longitudinal Transition Study 2012.
For the youth survey, the sensitivity weights had smaller effects on the distribution of the age when youth first received special education services than was the case for the parent survey (lower panel of table 27). Consequently, the weight adjustment factors for the youth survey were close to 1 . Specifically, the average weight for youth who first received special education services before age 8 was 1.7 percent higher under the sensitivity weight than under the enrolled youth weight. It was 1.3 and 4.0 percent lower, respectively, for youth who first received special education services at age 8 or later or who never received them.

After applying the appropriate adjustment factor to the enrolled youth weight of each sample member with an IEP, survey measures reported in Volumes 1 and 2 were re-estimated using the sensitivity weight. The measures considered in each volume include indicators of personal, family, and school characteristics; health, functional abilities, and independence; engagement in school and with friends; academic services and supports received through school and at home; and preparation for the future. The resulting sensitivity estimates were compared with those reported in the two volumes as follows:

- NFS-reweighted sensitivity analyses for Volume 1. The sensitivity analyses focused on comparisons between youth with an IEP and three groups of other youth: all youth without an IEP, youth with a 504 plan but no IEP, and youth with neither a 504 plan nor an IEP.
- NFS-reweighted sensitivity analyses for Volume 2. The sensitivity analyses focused on comparisons between each of the 12 IDEA disability groups and the average for all youth with an IEP.

Because the goal of the NFS-reweighted sensitivity analysis is to determine whether nonresponse bias could affect the findings reported in Volumes 1 and 2, the analysis follows the convention used in those reports. A difference is designated as statistically significant if the hypothesis of no difference is rejected using a two-
tailed $t$-test with a 95 percent confidence level. Because of the large number of comparisons made and to call attention to substantive and policy relevant findings, the volumes highlight only the statistically significant differences that are at least 5 percentage points-referred to in this design documentation as "substantial" differences.

In the NFS-reweighted sensitivity analysis results, a between-group comparison is counted as having changed statistical significance status if it shifted across one of the following three categories:

1. Not statistically significant (and magnitude of between-group differences is not evaluated)
2. Statistically significant and less than 5 percentage points (not substantial)
3. Statistically significant and at least 5 percentage points (substantial)

## 2. NFS-reweighted sensitivity analysis findings

Nearly all estimates for all youth with an IEP and for each IDEA disability group only changed by a small amount using the sensitivity analysis weights, leading to few changes. In terms of magnitudes, 95 percent of the estimates in Volumes 1 and 2 shifted by 1.0 percentage points or less (table 28). No estimate changed by more than 1.6 percentage points in Volume 1, and no estimate changed by more than 2.6 percentage points in Volume 2. In addition, at least 80 percent of the estimates in each report changed by, at most, 0.5 percentage points ( 88 percent for Volume 1 and 80 percent for Volume 2).

Table 28. Changes in magnitude for estimates of study measures for all youth with an IEP and for each IDEA disability group when NFS-reweighted estimates are used

Source: National Longitudinal Transition Study 2012.

Changes in whether estimates of group means differed by statistically significant or substantial amounts occurred for a small percentage of the between-group comparisons presented in the NLTS 2012 report. In Volume 1, only 3 percent of estimates of differences in group means changed status as statistically significant and substantial (exceeding 5 percentage points), statistically significant but not substantial, or not statistically significant (table 29, column 3). Furthermore, only 2 percent changed solely in terms of whether they were statistically significant or not, irrespective of magnitude (column 4). These findings are based on approximately 1,200 comparisons between all youth with an IEP and the three groups of youth without an IEP (all, those with a 504 plan, and those without a 504 plan) contained in the appendices of the NLTS 2012 report Volume 1. The 1,200 comparisons are across all levels of 151 study measures. That is, each categorical level of each measure in the volume (e.g., agree a lot, agree a little, disagree a little, disagree a lot) provides a set of three comparisons between groups of youth.

In Volume 2, only 4 percent of estimates of mean differences changed status as statistically significant and substantial, statistically significant but not substantial, or not statistically significant. Furthermore, only 3 percent changed solely in terms of whether they were statistically significant or not, irrespective of magnitude. These findings are based on approximately 1,900 comparisons between each of the 12 IDEA disability groups and the average for all youth with an IEP on nearly the same set of study measures. ${ }^{21}$

[^14]
## Table 29. Number and percentage of between-group comparisons made in the NLTS 2012 report Volumes 1 and 2 that result in a different hypothesis test outcome using the NFS-reweighted sensitivity estimates

|  |  | Between-group comparison level |  |
| :--- | :--- | :--- | :--- | :--- | :--- |

${ }^{1}$ Indicates the sum across all the levels of all the measures examined in the volumes, multiplied by the number of between-group comparisons per measure. The number of between-group comparisons per measure is 3 for Volume 1 and 12 for Volume 2.
${ }^{2}$ Indicates the number and percentage of comparisons where the outcome of the hypothesis test changes between the following statuses: (1) not statistically significant, (2) statistically significant and magnitude of difference is less than 5 percentage points, or (3) statistically significant and magnitude of difference is at least 5 percentage points.
${ }^{3}$ Indicates the number and percentage of comparisons where the outcome of the hypothesis test changes between the following statuses: (1) not statistically significant or (2) statistically significant.
${ }^{4}$ Indicates the sum across all the measures examined in the volumes, treating different levels of a measure as the same measure.
${ }^{5}$ Indicates the number and percentage of measures where the outcome of at least one hypothesis test involving the measure changes between the following statuses: (1) not statistically significant, (2) statistically significant and magnitude of difference is less than 5 percentage points, or (3) statistically significant and magnitude of difference is at least 5 percentage points.

Changes in estimates used for comparing youth with and without an IEP do not alter key findings presented in Volume 1. To provide a more concrete understanding of how the NFS-reweighted sensitivity estimates may affect specific key study findings and conclusions, table 30 lists the 105 variables that are included in the main body of Volume 1 (drawn from 151 total measures included in its appendices). The table shows the value of these key variables for all youth with an IEP using the enrolled youth analysis weights, the change in the value due to the NFS-reweighted sensitivity analysis weights, and an indication of whether the sensitivity analysis result changed the statistical and/or substantive significance of each difference between all youth with an IEP and all youth without an IEP.

All but 6 of the 105 estimates for youth with an IEP change by an amount less than or equal to 1.0 percentage point in absolute value. In all six cases that do change by more than 1.0 percentage point, the conclusion about whether there was a statistically significant and/or substantive difference between all youth with IEP and all youth without an IEP was unaffected.

Two of the 105 estimates (about 2 percent) of comparisons between youth with and without an IEP resulted in a different hypothesis test outcome:

- Percentages of youth who are limited English language proficient (NLTS 2012 report, Volume 1, figure 5). The point estimate for youth with an IEP increased by 0.3 percentage points using the sensitivity analysis weights. The difference between youth with an IEP and all youth without an IEP changes from "not statistically significant" to "statistically significant but not substantial."
- Percentages of youth attending a lower-performing school (NLTS 2012 report, Volume 1, figure 7). The point estimate for youth with an IEP increased by 0.4 percentage points using the simulation weights. The difference between youth with an IEP and all youth without an IEP changes from "not statistically significant" to "statistically significant but not substantial."

Changes in estimates used for comparing specific IDEA disability groups and all youth with an IEP do not alter key findings presented in Volume 2. The executive summary of the Volume 2 report presents data on seven key measures for youth in each IDEA disability group that are associated with positive post-high school outcomes among youth with an IEP. The seven key measures are (1) above or below average on the activities of daily living index, (2) gets together weekly with friends, (3) participates in a school sport or club, (4) has never been suspended, (5) has taken a college entrance or placement test, (6) has recent paid work experience, and (7) parent expects youth to live independently. As an example of how the NFS-reweighted sensitivity analysis would affect a set of key findings in Volume 2, the study examined whether it would alter the overall designation of each disability group as, on average, "higher risk than all youth with an IEP" or "similar or lower risk than all youth with an IEP." The NFS-reweighted results do not affect which disability groups are placed in the two risk categories based on the seven key measures.

In particular, youth with autism, deaf-blindness, intellectual disabilities, multiple disabilities, or orthopedic impairments appear to be at higher risk based on at least three of the measures under both the enrolled youth analysis weights and the NFS-reweighted sensitivity analysis weights. The other disability groups have similar or lower risk, on average, than all youth with an IEP under both sets of weights. ${ }^{22}$

[^15]Although the NFS-reweighted sensitivity analysis weights do not affect the overall risk designations, some designations on the individual measures changed for two disability groups:

- For youth with hearing impairments, two of the seven key measures in Volume 2 change. First, instead of the proportion who get together with friends weekly being close to the average for all youth with an IEP, the proportion in the sensitivity analysis is below average (higher risk than all youth with an IEP). Second, instead of parents of youth with hearing impairments being more likely than parents of all youth with an IEP to expect their child to live independently by age 30, the proportion with this expectation in the sensitivity analysis is not statistically different from that of all youth with an IEP on average. Because youth with hearing impairments are not at higher risk based on any of the other five key measures, these two changes (particularly the first one) do not elevate the group's overall risk status.
- For youth with other health impairments, one of the seven key measures in Volume 2 changes. Specifically, the proportion of parents who expect their child to live independently changes from being larger than that of youth with an IEP on average by a statistically significant margin exceeding 5 percentage points to being larger by a statistically significant margin that is smaller than 5 percentage points. This change does not elevate the overall risk status of youth with other health impairments; they remain at similar or lower risk than youth with an IEP overall.

In summary, reweighting to compensate for the greater nonresponse of parents who reported their child first received special education services at age 8 or later or never received services produced changes in some estimates for youth with an IEP. However, these changes were small compared with the differences between youth with and without an IEP, and did not materially affect conclusions about differences in their characteristics or experiences. Changes in point estimates and estimates of between-group differences were similarly small and infrequently statistically significant for the comparisons of each IDEA disability group to all youth with an IEP.

## Chapter 8. Item nonresponse, imputation, and disclosure protection

This chapter describes the procedures used to analyze item-level nonresponse, impute the missing values of the selected variables, and protect confidential data. Section A describes the methods and results of the item-level nonresponse analysis. Section B summarizes the procedures used for imputing the missing values of two variables. Section C outlines the steps taken to guard against disclosure of individually identifiable information in the restricted-use data file (RUF).

## A. Analysis of the potential for item-level nonresponse bias

A comprehensive assessment of the potential for nonresponse bias must consider the possibility of bias because some study participants do not answer specific survey questions, even though they are counted as respondents. Item nonresponse analysis complements unit nonresponse analysis by focusing on the additional potential for bias due to low rates of response to specific survey items.

Item nonresponse analysis starts by identifying survey items with a low response rate. The item response rate is defined as the percentage of survey respondents who were asked to respond to a specific question and provided a valid response. After items with high item nonresponse have been identified, the characteristics of itemrespondents and item-nonrespondents are compared, using measures calculated from data available for both groups. As in the unit nonresponse analysis, the characteristics available for both item-respondents and itemnonrespondents are proxies for the survey items considered. Statistically significant differences between item respondents and nonrespondents in the distributions of the measured characteristics may indicate a higher potential for nonresponse bias. Because different study participants may decline to respond to different survey items, the item nonresponse rate and composition of the respondent and nonrespondent groups may differ across survey items.

The first section that follows provides details on how items with high nonresponse are identified, and which measures are used to gauge the potential for nonresponse bias for survey items with high nonresponse rates. The second presents the findings on which parent survey and youth survey items have high nonresponse rates. The third section summarizes findings on the extent and patterns of difference between item respondents and nonrespondents. Appendix F provides tables comparing the characteristics of respondents and nonrespondent for each high nonresponse item.

## 1. Method for evaluating item nonresponse bias

Identifying high nonresponse survey items. Consistent with National Center for Education Statistics (NCES) statistical standards, the item nonresponse analysis focuses on survey items for which less than 85 percent of respondents (weighted) provided valid data. The weights used in the item nonresponse calculations adjust for unit-level nonresponse. For items with a weighted response rate of 85 percent or higher, the potential for nonresponse bias is expected to be less of a concern, although the potential for nonresponse bias may remain if nonresponse is concentrated in a sector of the population. The item response rate is calculated as:

$$
\begin{equation*}
R_{k}=\frac{V_{k}}{N-N A_{k}} \tag{8.1}
\end{equation*}
$$

where $V_{k}$ is the weighted number of valid responses for survey item $k, N$ is the weighted total number of responding survey cases at a unit level, and $N A_{k}$ is the weighted number of cases for which item $k$ was not applicable or legitimately skipped. For example, all respondents to the parent survey were asked whether their youth was enrolled in elementary, middle, or high school during the current (or immediately preceding) school year. If a parent responded "no" to this gateway question, they were not asked follow-up questions about the grade or type of school attended. These cases would be recorded as "not applicable/legitimate skip" and excluded from the denominator and numerator of the item response rate for the items "grade in school" and "type of school attended".

Data were edited for internal consistency before calculating the item response rate. The weighted item response rates for all parent and youth survey items were computed using the all youth weights (see chapter 6) because item nonresponse bias is a potential problem for all youth in the sample, not just those enrolled in school at the time of the survey. These weights differ from those used for the NLTS 2012 main reports, which used the enrolled youth weights instead because the focus of the analysis was limited to youth who were enrolled in school when the survey was completed.

Estimating the potential for nonresponse bias for survey items with high nonresponse rates. Evaluation of the potential for item nonresponse bias adapts the methods described in section B of chapter 7 for evaluating the potential for nonresponse bias at the youth level. Estimated bias focuses on the difference between survey item respondents and item nonrespondents on a set of characteristics measures available for all youth sample members who completed or whose parent completed the appropriate survey. This difference is multiplied by the itemnonresponse rate to calculate estimated bias. The expression for estimating item nonresponse bias is

$$
\begin{equation*}
\hat{B}_{k j}=R_{k}\left[\hat{Y}_{R k j}-\hat{Y}_{N R k j}\right] \tag{8.2}
\end{equation*}
$$

where $k$ is the survey item being evaluated, $j$ is the measure used to define population characteristics for purposes of evaluating potential bias, and $R_{k}$ is the weighted item nonresponse rate for item $k . \hat{Y}_{R k j}$ and $\hat{Y}_{N R k j}$ are estimates of the means for item $k$ respondents and nonrespondents in the subpopulations defined by characteristic $j$, respectively. As in the evaluation of unit nonresponse, the variables $j$ used to define the subpopulations for the estimates of $\hat{Y}_{R k j}$ and $\hat{Y}_{N R k j}$ should be correlated with the survey items and available for all or nearly all survey respondents.

A set of measures defining key groups for which findings are reported in the first two volumes of the NLTS 2012 report are used (essentially as independent variables) for evaluating the potential for item nonresponse bias on high nonresponse survey items. The following groups were defined based on youth and family characteristics and school characteristics (weighted item response rate for these variables shown in parenthesis):

## Youth and family characteristics

- Youth disability group. Individualized education program (IEP), no IEP, 504 plan but no IEP, neither 504 plan nor IEP ( $100 \%$ ). Estimates of "no IEP" are based on the combined " 504 plan but no IEP" and "neither 504 plan nor IEP" groups.
- Household income. Low income below 185 percent of the federal poverty level) and higher income ( $100 \%$ with imputation)
- Race/ethnicity. Black, Hispanic, neither (100\%)
- Gender. Female, male ( $100 \%$ )
- Age at parent interview. 13 to 14 years old, 15 to 18 years old, and 19 to 22 years old ( $100 \%$ )
- Parent's perception of youth's functional abilities. Lower (youth is below the mean for all youth with an IEP on a composite measure of the youth's ability to perform typical teenage tasks) and higher (99\%)

## School characteristics

- Academic proficiency. Bottom quartile in a state (school's average math and reading academic proficiency rate is in the lowest quartile in the state or the top three quartiles) or top three quartiles in the state ( $95 \%$ )
- Locale from the Common Core of Data (CCD). City, suburb, town or rural (97\%)
- Share of students who have an IEP. Bottom three quartiles in the United States (percentage of students in youth's school who have an IEP is in the bottom three quartiles) or highest quartile in the United States (96\%)

This set of variables was chosen to allow users of the NLTS 2012 reports to assess the extent to which item-level nonresponse bias might have affected specific study findings.

## 2. Survey items with high nonresponse rates

Approximately 9 percent ( 50 of 548) of items on the parent survey and 2 percent ( 9 of 462 ) of items on the youth survey had a weighted item response rate of less than 85 percent. Table 31 lists these items for the parent survey, presenting data on percentages of the full respondent sample in three response categories (valid, not applicable, and missing) and the weighted and unweighted item response rates. Response rates for these items ranged from 3 to 84 percent. Among these 50 items, the high nonresponse related to leaving school (B5 to B11) and age or grade at which the youth's disability was identified and special education services initiated (D4_Age to D4a_Grade) were partly the result of problems with the skip logic, which created some missing data. The weighted response rate for the following 36 of the 50 parent survey items was 70 percent or lower:

- Consent to acquire administrative data about youth's experiences after leaving high school (including college enrollment and employment) (A7): 60 percent
- Specific "other reason" why youth left school (B5a_01 - B5a_99): 21 percent
- Whether out-of-school youth had taken courses or tests to earn a high school diploma (B7): 45 percent
- Number of months and number of years since youth had received instruction (B9 MonthsAgo and B9_LongAgoYr): 3 percent
- Month and year youth last received instruction in school subjects (B9_mon and B9_year): 34 percent. Months since youth received instruction in school subjects (B9MonthsAgo): 35 percent.
- Age when the disability became apparent (D4_Age): 42 percent. Grade when disability became apparent (D4_Grade): 52 percent. 64 percent of parents provided one of these two measures.

Table 31. NLTS 2012 parent survey items with weighted response rate less than 85 percent

| Variable | Variable name | Percentage of cases with valid data | Percentage of cases with legitimate skip/not applicable | Percentage of cases with missing data | Unweighted item response rate | Weighted item response rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| A14a_CheckBox | P1: A14a checkbox not In school | 0.6 | 99.1 | 0.2 | 74.8 | 79.8 |
| A7 | P1: Parent consent for administrative records | 52.9 | 0.0 | 47.1 | 52.9 | 59.9 |
| B11 | P1: Expect youth will be enrolled in school in the fall | 58.0 | 25.5 | 16.5 | 77.8 | 71.0 |
| B5 | P1: Reason youth not in school now | 11.0 | 85.3 | 3.8 | 74.3 | 80.0 |
| B5a_01 | P1: Reasons for leaving school: academic difficulty | 1.0 | 95.2 | 3.8 | 20.7 | 21.6 |
| B5a_02 | P1: Reasons for leaving school: dislike of school experiences | 1.0 | 95.2 | 3.8 | 20.7 | 21.6 |
| B5a_03 | P1: Reasons for leaving school: school too dangerous | 1.0 | 95.2 | 3.8 | 20.7 | 21.6 |
| B5a_04 | P1: Reasons for leaving school: failed req test, grad exam | 1.0 | 95.2 | 3.8 | 20.7 | 21.6 |
| B5a_05 | P1: Reasons for leaving school: lack of appropriate curriculum | 1.0 | 95.2 | 3.8 | 20.7 | 21.6 |
| B5a_06 | P1: Reasons for leaving school: poor relationships with teachers | 1.0 | 95.2 | 3.8 | 20.7 | 21.6 |
| B5a_07 | P1: Reasons for leaving school: poor relationship with students | 1.0 | 95.2 | 3.8 | 20.7 | 21.6 |

| c_consent_admin | Youth who consented and whose parent consented to provide administrative data | 49.3 | 0.0 | 50.7 | 49.3 | 55.8 |

Note: Weighted item response rates are calculated with all youth weights for the parent survey.
Source: National Longitudinal Transition Study 2012.

Youth survey items with weighted response rates below 85 percent are shown in table 32. The weighted response rates for these 9 items ranged from 48 to 84 percent. Among these items, the high nonresponse related to attending a transition planning meeting (L2) were the result of problems with the skip logic, which created missing data. Due to the skip patterns in the youth survey, the error also led to lower response rates for youth's role in the transition planning meeting (L2a), whether staff made a short summary of meeting goals (L3), and whether you provided at least some input (y_y_goalsomeinput). The following three items had response rates less than 70 percent:

- Whether a youth with a child had received child care for the child at school (K9k1): 66 percent
- Whether the youth expected to be financially independent by age 30 (Q3): 48 percent
- Consent to acquire administrative data about the youth's experiences after leaving high school (c_consent_admin): 61 percent

Table 32. NLTS 2012 youth survey items with weighted response rate less than 85 percent

## 3. Summary of findings on the potential for item nonresponse bias

Users of the NLTS 2012 parent and youth surveys should interpret estimates based on items with high nonresponse rates cautiously. As a proxy for the potential for bias, the study examined differences between the characteristics of item respondents and nonrespondents on the set of measures available for both groups listed above. If the proportions of respondents and nonrespondents with a particular characteristic differ, this difference indicates a greater potential for nonresponse bias on that survey item. However, actual bias in the item depends on the size of the difference between what respondents reported and the unobserved responses of the nonrespondents. Therefore, the estimates should be considered indicators of the potential for nonresponse bias, rather than firm evidence of nonresponse bias.

Estimated bias was computed for each item with a high item nonresponse rate for each of 27 groups formed using the 59 variables ( 50 parent survey items and 9 youth survey items). Table 33 illustrates this item-level analysis for the parent survey item B7 (whether the youth has taken any course or tests to earn college credit). The percentage of youth in each IEP status group did not differ between respondents and nonrespondents to this item. In contrast, the negative estimated bias estimate for the age 15 to 18 group indicates that nonrespondents to item B7 are more likely to have children who are ages 15 to 18 than are respondents to the item. Similarly, nonrespondents are more likely than respondents to report that their children have higher functional abilities. Results for each of these 59 items are shown in a separate table in appendix F.

For the parent survey, 1,350 bias estimates were calculated and 26 percent were statistically significant (table 34). Because of the number of tests computed, one would expect 5 percent of the tests would be statistically significant by random chance. The 26 percent that were statistically significant exceeds this 5 -percent level. Statistically significant differences were most common when comparing respondent and nonrespondents based on the youth's age group ( 19 to 22 years old, 88 percent) and whether the youth's household income was below 185 percent of the federal poverty level ( 68 percent).

For the youth survey, the overall percentage of bias estimates that were statistically significant was similar to the parent survey, although different groups had the highest percentages. A total of 243 differences in proportions were tested and the estimated bias was statistically significant in 69 of these tests or 28 percent (table 35). Statistically significant differences between respondents and nonrespondents were most common based on youth's age group ( 15 to 18 years old, 67 percent of tests), disability status (IEP, no IEP, neither 504 plan nor IEP, 63 percent), and whether the youth was in a lower-performing school ( 56 percent).

Table 33. Comparison of item respondents and nonrespondents for parent survey item B7 (P1: Youth taken any courses or tests to earn high school diploma)

| Characteristic | Overall percent | Respondent percentage | Nonrespondent percentage | Estimated bias | Statistically significant |

!=interpret data with caution. Estimate is unstable because the standard error represents more than 30 percent of the estimate; \#=Estimate rounds to zero; $\dagger=$ Not applicable.

Notes: Percent estimated for total, respondents, and nonrespondents were calculated with the analytic weight after adjustments for parent survey nonresponse. Estimated bias is calculated as the weighted nonresponse rate times the difference in the weighted respondent and nonrespondent means. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.

!=interpret data with caution. Estimate is unstable because the standard error represents more than 30 percent of the estimate; \#=Estimate rounds to zero; $\dagger=$ Not applicable.

Notes: The relative bias is calculated as the estimated bias divided by the estimated value. The absolute relative bias is the absolute value of the relative bias.

Source: National Longitudinal Transition Study 2012.

## B. Imputing missing data procedures for variables

Two variables critical for analyzing household background characteristics and nonresponse bias had missing values that the study replaced with imputed values. They are described below.

A binary variable that indicates whether the youth sample member is from a low-income household. This variable is defined as household income below 185 percent of the federal poverty level. It was imputed due to associations between low household income, IEP status, and subsequent outcomes as youth transition to life after high school. The nonimputed values of this variable are based on the survey completion date, household size, household income, and state of residence questions in the questionnaire. Values for the variable were imputed when household size, household income, or state of residence was missing or if the household size was zero. This imputation occurred for just over 7 percent of the parent survey respondents. It was not imputed for cases in which the respondent was not asked the income question, which occurred for just over 1 percent of the parent respondents. These legitimate skips could occur if (1) the youth sample member did not live with the parent survey respondent at least some of the time or (2) the living situation of the youth sample member was unknown. The variable was imputed using the following hot deck procedure:

- After excluding the cases with legitimate skips, the remainder of cases were separated into (1) those without missing data ("donors"), and (2) those with missing data where the variable needed to be imputed ("recipients"). Donors and recipients were grouped into homogeneous cells called imputation classes, and within each imputation class, nonmissing values of the variable for the donor were assigned to a similar recipient.
- The variables used to define the imputation classes were those most highly correlated with whether the household's income was above or below 185 percent of the federal poverty level, as determined from logistic regression models with the indicator for a low-income household as the dependent variable. These variables included receipt of Supplemental Nutrition Assistance Program benefits, Temporary Assistance for Needy Families, or Supplemental Security Income; parent's education and marriage status; ethnicity and youth's English proficiency; and youth's disability and overall health status. Different models were fit and different hot deck imputations were processed based on the covariates available for each case with missing data.
- Within each imputation class, donors and recipients were sorted together based upon other variables related to household income status, so that donors and their respective recipients were similar based upon these variables. The sorting variables were generally less correlated with the response variable than the classing variable, and were listed in order of importance. The variables were a mix of administrative variables and survey variables, and the approach required 11 separate imputation models.

The age when the youth first received special education services. This variable contains imputed values for about 6 percent of parent respondents. Missing values were imputed because of its importance for the unit nonresponse bias analysis. The imputed values are based on a regression of the age when the youth first received special education services on indicators for youth disability groups, the age when their disability was identified, and the interactions between the disability group indicators and the age when their disability was identified. ${ }^{23}$

[^16]
## C. Disclosure risk analysis and protection

The NLTS 2012 RUF contains data on all sampled youth in the study. Each record represents a sampled youth and contains information from administrative records and, for survey respondents, data from the parent and youth surveys. The RUF comes with separate data file documentation (Bloomenthal et al., 2017).

The RUF omits certain data items to protect respondents' confidentiality. These items include birth dates (which were consolidated into age groups), names of respondents, respondents' contact information, district identifiers, and open-ended responses (which were transformed into categorical variables). In addition, some less frequent categories of the categorical variables for school type, household language, and race were consolidated. Information from the parent survey question on household income was converted into a categorical variable consisting of $\$ 20,000$ income ranges. Some of the school-level variables were collapsed into categorical indicators, including the percentage of youth with an IEP and math and reading proficiency rates. Data for one variable were swapped between data records within gender and age group to protect the identity of study participants, as required for disclosure review board approval.

Page left intentionally blank for double sided printing

## Chapter 9. Selection of analytic variables and development of indices and measures that involve administrative data

This chapter describes the variables that were used in the NLTS 2012 report Volumes 1 and 2. It then discusses the construction of indices used in the analysis, as well as constructed measures that involve administrative data.

## A. Selection of analytic variables

The study used information collected through the parent and youth surveys, and from administrative sources, to address five broad questions of interest to policymakers, educators, and other stakeholders. These questions are listed below, as they appear in Volumes 1 and 2 (Lipscomb et al., 2017a, 2017b). As in other IES reports, not every measure from the surveys is included in the report. Measures that were not relevant to the five questions below are not included. ${ }^{24}$

- What are the background characteristics of youth and the schools they attend?
- What challenges do youth face relating to health, functional abilities, and independence?
- How engaged are youth in school and with friends?
- What academic supports do youth receive?
- How are youth preparing for life after high school?

The full set of analytic variables used in Volumes 1 and 2 are provided in table 36, organized by the five questions addressed in each volume. The table indicates the variable name from the RUF, the appendix table, and whether the variable appears in the main body. Volume 3 uses a subset of these variables that are comparable across the NLTS and/or the NLTS 2. More detail on the analytic variables used in Volume 3 are provided in that volume.

[^17]
## Table 36. Variables used in the NLTS 2012 report, volumes 1 and 2

|  |  |  |  |
| :--- | :--- | :--- | :--- |

| Description | Variable name | Volume 1 |  | Volume 2 |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Appendix table number | Included in main body | Appendix table number | Included in main body |
| How well youth speaks clearly | p_y_speak | C-6 | No | C-6 | No |
| How well youth carries on an oral conversation | p_y_converse | C-7 | No | C-7 | No |
| How well youth sees (with glasses or contacts if used) | p_y_see | C-8 | Yes | C-8 | Yes |
| How well youth hears (with a hearing aid if used) | p_y_hear | C-9 | Yes | C-9 | Yes |
| How well youth uses arms and hands | p_y_armshands | C-10 | Yes | C-10 | Yes |
| How well youth uses legs and feet | p_y_legsfeet | C-11 | Yes | C-11 | Yes |
| Youth functional abilities index score (0 is low, 3 is high) | p_y_func_index | C-12 | No | C-12 | No |
| How well youth uses an ATM or cash machine | p_y_useatm | C-13 | Yes | C-13 | Yes |
| How well youth makes appointments | p_y_makeappt | C-14 | Yes | C-14 | Yes |
| How well youth gets to places outside the home | p_y_getplace | C-15 | Yes | C-15 | Yes |
| Frequency youth fixes own meals | p_y_fixmeal | C-16 | Yes | C-16 | Yes |
| Frequency youth does laundry | p_y_dolaundry | C-17 | Yes | C-17 | Yes |
| Frequency youth straightens up own room or living area | p_y_cleanroom | C-18 | Yes | C-18 | Yes |
| Frequency youth buys a few things needs at the store | p_y_buything | C-19 | Yes | C-19 | Yes |
| Youth activities of daily living index score (0 is low, 3 is high) | p_y_daily_index | C-20 | No | C-20 | No |
| Youth with higher activities of daily living index scores | p_y_daily_index_group | C-48, C-50 | Yes | $\begin{aligned} & \text { C-21, C-49, C-51, } \\ & \text { C-53 } \end{aligned}$ | Yes |
| Youth has a driver's license or learner's permit | y_y_havelicense | C-23 | Yes | C-22 | Yes |
| Youth is registered to vote | y_y_registervote | C-24 | No | C-23 | Yes |
| Youth has a savings or checking account | y_y_haveaccount | C-21 | Yes | C-24 | Yes |
| Youth has an allowance or other money that can decide how to spend | y_y_haveallowance | C-22 | Yes | C-25 | Yes |
| How often youth chooses activities to do with friends | y_y_chooseactivity | C-25 | Yes | C-26 | Yes |
| How often youth writes letters, texts, or talks on phone to friends and family | y_y_writefriend | C-26 | Yes | C-27 | Yes |
| How often youth chooses gifts to give to family and friends | y_y_givegift | C-27 | Yes | C-28 | Yes |
| How often youth plans weekend activities that s/he likes to do | y_y_planweekend | C-28 | Yes | C-29 | Yes |
| How often youth goes to restaurants that s/he likes | y_y_restaurant | C-29 | Yes | C-30 | Yes |
| How often youth goes to movies, concerts, and dances | y_y_attendevent | C-30 | Yes | C-31 | Yes |
| How often youth volunteers in activities of interest | y_y_volunteertime | C-31 | Yes | C-32 | Yes |
| Youth personal autonomy index score ( 0 is low, 3 is high) | y_Y_autonomy_index | C-32 | No | C-33 | No |

## B. Indices and constructed measures that involve administrative data

This section describes indices and constructed measures the study developed based on administrative data. Administrative sources included school district records provided as part of the sample frame and records maintained by the U.S. Department of Education's Common Core of Data, EDFacts, and Office of Civil Rights. Brief descriptions of all analytic variables can be found in the note and source fields below each table or figure. In addition, detailed descriptions of each variable are provided to users of the NLTS 2012 data in the NLTS 2012 RUF documentation (Bloomenthal, et al. 2017).

## 1. Indices

- Functional abilities index ( $p_{-} y_{-}$func_index). This index is a measure of the prevalence and degree of functional limitations. The index comprised eight parent-reported categorical measures of the youth's abilities drawn from the NLTS 2: the ability to communicate, the ability to speak clearly, the ability to carry on an oral conversation, the ability to understand what people say, the ability to see, the ability to hear, the ability to use arms and hands, and the ability to use legs and feet. Each component measure has categorical values from 0 to 3 (table 37). The index is the average of parent ratings on each of the eight component measures and has values ranging from 0 to 3 , with higher values representing greater functional abilities index scores. The internl consistency is 0.79 . ${ }^{25}$ The analysis focuses on whether youth have an index value at or above (versus below) the average for all youth with an IEP. The study team used this level as an approximation of higher and lower functional abilities (less complex and more complex functional needs). In addition to the challenges that physical limitations can pose, research finds a link, particularly among youth with severe disabilities, between being able to communicate and understand others without trouble and a greater likelihood of being employed after high school (Carter et al., 2012).

## Table 37. Components of the functional abilities index

## Components of the index

How well does \{youth\}:

- Communicate by any means
- Speak clearly How well does \{youth\}:
- Carry on an oral conversation
- Understand what others say to them
- See with glasses or contacts
- Hear with a hearing aid

Does \{youth\} use both of the following normally:

- Arms and hands
- Legs and feet

Response categories for components
(3 points) Normally
(2 points) Has a little or mild amount of trouble
(1 point) Has a lot or moderate amount of trouble
(O points) Does not at all or has a severe to profound amount of trouble
Does \{youth\} use both of the following normally:
(3 points) Yes
(1 point) No
(O points) Has no use of one or both

Note: For this report, a response of "No" in reference to whether youth have normal use of both arms and hands, or of both legs and feet, has been interpreted as "No (but has some use of both)". The NLTS 2012 parent survey does not fully define the difference between responses of "No" and "Has no use of one or both," and parent survey respondents may have interpreted the response categories in different ways. The only instruction in the survey is that youth who were missing an arm/hand or a leg/foot should be counted as having no use of one or both.

Source: National Longitudinal Transition Study 2012

[^18]- Activities of daily living index (p_y_daily_index). This index is a measure of the extent of youth abilities to complete several typical teenage tasks independently, based on both the number of tasks completed and how well or often youth complete them. The index comprised seven categorical measures drawn from the NLTS 2: how well the youth uses an ATM without help, how well the youth makes appointments without help, how well the youth gets to nearby places without help, frequency the youth fixes a meal when needed without help, frequency the youth does laundry when needed without help, frequency the youth cleans rooms when needed without help, frequency the youth buys things when needed without help. Each component measure has categorical values from 0 to 3 (table 38). The index is the average of parent ratings on each of the seven component measures and has values ranging from 0 to 3 , with higher values representing greater activities of daily living index scores. The internal consistency is 0.82 . The analysis focuses on whether youth have an index value at or above (versus below) the average among all youth with an IEP. The study team used this level as an approximation of higher and lower task performance. Research studies have found that youth with an IEP who perform these activities of daily living were more likely to be employed after high school and to report higher quality of life (Carter et al., 2012; Roessler, Brolin, \& Johnson, 1990).

## Table 38. Components of the activities of daily living index

Components of the index
How well does \{youth\} do each of the following without help:

- Use an ATM or cash machine
- Make appointments, such as with a doctor, dentist, or potential employer
- Get to places outside the home, like to school, to a nearby store or park, or to a neighbor's house

When the following chores need doing, about how often does \{youth\} do the following:

- Fix own breakfast or lunch
- Do laundry
- Straighten up own room or living area
- Buy a few things at the store

Response categories for components

How well does \{youth\} do each of the following without help:
(3 points) Very well
(2 points) Pretty well
(1 point) Not very well
(O points) Not at all well or not allowed
When the following chores need doing, about how often does \{youth\} do the following:
(3 points) Always
(2 points) Usually
(1 point) Sometimes
(O points) Never

Source: National Longitudinal Transition Study 2012.

- Personal autonomy index ( $y_{-} y_{-}$autonomy_index). This index is a measure of the extent youth report acting according to their preferences, interests, and abilities. The index comprised seven categorical measures: frequency the youth chooses his or her activities with friends; frequency that the youth communicates with friends and family; frequency the youth chooses gifts to give family and friends; frequency the youth goes to restaurants that he or she likes; frequency the youth goes to movies, concerts, and dances; frequency the youth plans weekend activities that he or she likes to do; and frequency the youth volunteers in activities of interest. Each component measure has categorical values from 0 to 3 (table 39). These measures come from the autonomy subscale of the Arc Self-Determination Scale. The index is the average of youth ratings on each of the seven component measures and has values ranging from 0 to 3 , with higher values representing greater personal autonomy index scores. The internal consistency is 0.78 . The analysis examines this index as a continuous measure rather than through assigning cutoffs. Many disability experts view youths' sense of self-determination, and particularly their sense of autonomy, as important for their success in adulthood (Shogren, Wehmeyer, Palmer, Rifenbark, \& Little, 2015; Shogren \& Shaw, 2016).

## Table 39. Components of the personal autonomy index

Components of the index

- My friends and I choose activities that we want to do
- I write letters, texts, or talk on the phone to friends and family
- I go to restaurants that I like
- I choose gifts to give to family and friends
- I go to movies, concerts, and dances
- I plan weekend activities that I like to do
- I volunteer in things I am interested in

Response categories for components
(3 points) I do every time I have the chance
(2 points) I do most of the time I have the chance
(1 point) I do sometimes, when I have the chance
(O points) I do not do, even if I have the chance

Source: National Longitudinal Transition Study 2012.

To assess whether the indices measure distinct domains, the study also examined the correlation among each pair of indices (table 40). Highly correlated indices may be measuring the same underlying construct. For all pairs among the three indices, the correlation coefficients are at most .52 , suggesting that the indices are not measuring the same construct.

Table 40. Pairwise correlations between indices

| Index | Functional abilities | Performance on <br> activities of daily living | Personal autonomy |
| :--- | :---: | :---: | :---: | :---: |
| Functional abilities | 1.00 |  |  |
| Performance on activities of daily living | 0.52 | 1.00 |  |
| Personal autonomy | 0.12 | 0.18 | 1.00 |

Source: National Longitudinal Transition Study 2012.

## 2. Constructed measures that involve administrative data

- Youth disability group (d_y_disability). This variable indicates the youth's primary disability group as reported by school districts. The categories are autism, deaf-blindness, emotional disturbance, hearing impairment, intellectual disability, multiple disabilities, orthopedic impairment, other health impairment, specific learning disability, speech or language impairment, traumatic brain injury, visual impairment, IEP but unspecified disability, 504 plan but no IEP, neither 504 plan nor IEP.
- Youth age (p_y_age). This variable indicates the youth's age in years at the time the parent survey respondent completed the parent survey. School districts provided the birth date information used in the study, which parents either confirmed or corrected in the survey.
- Youth gender ( $p_{-}$y_gender). This variable indicates whether the youth is male or female. The variable relies on district-reported data when parent-reported data is missing.
- Youth race/ethnicity (p_y_raceeth3). This variable indicates whether the youth is Black (not Hispanic); Hispanic; or White, Asian, or other race (not Hispanic). Black includes African American. Hispanic includes Latino. Other race includes American Indian or Alaska Native, and Native Hawaiian or other Pacific Islander. The variable relies on district-reported data when parent-reported data is missing.
- Youth limited English proficiency status (d_y_lep). This variable indicates whether the youth is limited English proficient or not, as reported by the school district.
- School's academic performance based on math and reading proficiency rates (sch_pctprof_q4). This variable is based on the academic proficiency rate of the school the youth attended at sampling, using EDFacts data for 2011-2012. Academic proficiency is expressed as the average of each school's rate of proficiency in math and in reading. The distribution of schools within each state was divided into quarters based on the average math and reading proficiency rate in each school. This variable has categorical values from 1 (lowest-performing quarter) to 4 (highest-performing quarter) to indicate a school's academic performance.
- School's locale (sch_locale). This variable indicates whether the school the youth attended at sampling is located in a city, suburb, or town or rural area, as indicated by the Common Core of Data for 2011-2012 or the Private School Survey for 2009-2010.
- School's share of students with an IEP (sch_pctiep_q4). This variable is based on the percentage of students who have an IEP at the school the youth attended at sampling. The percentage of students who have an IEP at a school is calculated by dividing the count of students with an IEP from EDFacts by all students from the Common Core of Data for 2011-2012 or from the Private School Survey for 2009-2010 (expressed as a percentage). If any data were missing, then the variable was set equal to the school percentage of students with an IEP from the U.S. Department of Education's Office for Civil Rights. The distribution of schools nationwide was divided into quarters based on the percentage of students in each school who received services under an IEP. This variable has categorical values from 1 (lowest national quarter) to 4 (highest national quarter).

# National Longitudinal Transition Study 2012 (NLTS2012) 

## Parent Baseline Questionnaire: Unified Survey Specifications

Unless specified, "Don't Know"/"Refused" were only options in 2012 CATI and "No
Response" was only an option in 2013 WEB

Responses with * are categories created after coding other specify responses
Reference year was "this school year", referencing 2011-2012 for cases completed in 2012 and 2012-2013 for cases completing in 2013. Cases that completed in August 2012-November 2012 had slightly revised language in questions so that respondents during this time always referenced the 2011-2012 school year.

Text in bold and italics was displayed on the web, but was a probe or interviewer instruction in CATI.
Text in italics (not bold) was a probe/interview instruction in CATI only, and was not displayed on the web.
Responses in bold were read aloud in CATI and displayed on the web. Otherwise (non-bolded/non-italicized text), the responses were displayed on the web, but were not read aloud in CATI.
(omitted)=variable not included in file

## A. INTRODUCTION AND CONSENT

## ALL

A1. The U.S. Department of Education is sponsoring the National Longitudinal (omitted) Transition Study. Through this important project, we hope to learn more about issues youth face today as they transition from school to adult life and how schools can better support students in reaching their goals.

## A1 $=4$

<Morelnfo.> (omitted)

People who create policies and run programs for schools want to know more about how to help students be prepared for life after high school. To collect this information, the U.S. Department of Education is sponsoring this study. The data will be used to improve the ways schools help students become productive adults. As a parent, your opinions and experiences are critical to the success of this study.

A2.
(omitted)
[YOUTH] is one of 18,000 students across the country being asked to take part in this voluntary study.
You will be paid [TOTAL INCENTIVE AMOUNT] total for each survey completed over the web. We will send you [POSTPAY AMOUNT] after this survey is complete.
You will be contacted for another survey in 2014, to see what may have changed. You will be asked about [YOUTH]'s experiences at school, hopes for the future, and some basic information about your household. This survey will take 30 to 35 minutes. We would also like to complete a survey with [YOUTH] for about 30 minutes. That survey has questions about experiences in and out of school and plans for the future. You can help your child answer questions or answer for [him/her], if needed. Students will be contacted for another survey in 2014. [YOUTH] will get a $\$ 10$ gift card for each survey completed.
All the information collected about [YOUTH] will be kept confidential and not shared with others. All reports will be in summary form only. Your child's name will never be used. There are no special risks to you or [YOUTH] from taking part in this study. If you or your child feels uncomfortable answering any of the questions, you can stop without penalty. We will mail you a letter describing this information, so you will have it for your records. Do you give your permission for these surveys?
If you have any questions please call: 1-866-964-7962

## C. PARENT INVOLVEMENT AT SCHOOL

C_INTRO The next set of questions is about your involvement in \{YOUTH\}'s experience at school. There are no right or wrong answers to these questions - only your experiences.

## AbbrevP $=0$

C1. Since the beginning of this school year have you or another adult in the household done any of the following at \{YOUTH'S\} school? (NLTS2, E1-REV)

## C1a - C1d FOR HOMESCHOOLERS, ACTIVITIES WITH OTHER HOMESCHOOLERS OR EDUCATION GROUPS MAY BE INCLUDED HERE.

C2. [IF C1=YES, ASK:] About how many times has that happened? Would you say 1-2 times, 34 times, 5-6 times, or more than that?

C2a-C2d
a. Attended a general school meeting, for example, back to school night, or a meeting of a parentteacher organization?
b. Attended a school or class event, such as a play, sports event, or science fair? This can include visits to the school for other children in the family who are at this school.
c. Volunteered at the school, for example, chaperoning a class field trip, or serving on a committee?
d. Gone to a parent/teacher conference with \{YOUTH\}'s teacher?

\end{aligned}
$$

| D3. | Did \{YOUTH\} ever receive special education services or have an IEP (Individualized Education Program)? |
| :---: | :---: |
|  | "IEP" stands for an Individualized Education Program. An IEP is a written statement for each student with a disability that sets goals for the student in school, says how progress will be measured, describes the special education and related services the school will provide, how much the student will be in the regular class with nondisabled students, and lists accommodations or modifications needed to measure what the student knows through tests. After a student turns 16, the IEP must also include goals for what the student will do after high school and services needed to help the student reach those goals. |

| :--- | :--- |
| CODE ALL THAT APPLY |  |

## D5b <> 8

D6. Has \{he/she\} ever had a Section 504 plan?
A Section 504 plan, which falls under civil-rights law, removes barriers so students with disabilities can participate in school as freely as possible. This may include students who do not need an IEP but may need extra help or assistance to participate fully in school. Such help may include more time on tests, or sitting in the front of the classroom. An IEP is more concerned with providing educational services.

H12/H13. Household income is an important factor that goes into many research questions - includ-ing how family finances affect students' ability to go to college or pursue other goals afterhigh school. This information is critically important to the success of this study and will bekept completely confidential.
What was your total household income from all sources before taxes and deductions incalendar year \{2011/2012\}? Please include all income such as income from work, invest-ments, money from public assistance, retirement, and alimony for all household members,before taxes. (HSLS, REV)
[in the RUDF responses from questions $\mathrm{H} 12, \mathrm{H} 13, \mathrm{H} 13 \mathrm{a}$ and H 13 b (see above) were coded/ combined into the following categories]CODE ONE ONLY

Appendix B. Youth baseline questionnaire

# National Longitudinal Transition Study 2012 (NLTS2012) 

## Youth Baseline Questionnaire: Unified Survey Specifications

Unless specified, "Don't Know"/"Refused" were only options in 2012 CATI and "No
Response" was only an option in 2013 WEB

Responses with * are categories created after coding other specify responses
Reference year was "this school year", referencing 2011-2012 for cases completed in 2012 and 2012-2013 for cases completing in 2013. Cases that completed in August 2012-November 2012 had slightly revised language in questions so that respondents during this time always referenced the 2011-2012 school year.

Text in bold and italics was displayed on the web, but was a probe or interviewer instruction in CATI.
Text in italics (not bold) was a probe/interview instruction in CATI only, and was not displayed on the web.
Responses in bold were read aloud in CATI and displayed on the web. Otherwise (non-bolded/non-italicized text), the responses were displayed on the web, but were not read aloud in CATI.
(omitted)=variable contains PII, not included in file.

<J2> (omitted)

Before we begin, I need to describe some important pieces of the study. Please ask me any questions as we go along. To begin, this is a voluntary research study. The purpose is to see what helps students move from school to adulthood. \{You are/\{NAME\} is\} one of 18,000 students being asked to take part in the study from across the United States. \{Your/\{NAME\}'s\} parent (or legal guardian) answered questions about \{your/his/her\} family, experiences, and supports \{you get/ he/she gets\} from school and other places. We already completed an interview with your parent or guardian who said you could take part in the study. But, you need to decide for yourself if you want to take part. Your parent (or guardian) can help you answer questions or answer for you, if needed.

If you agree, I will complete \{your/\{NAME\}'s\} interview over the telephone. It takes about 30 minutes. The questions will be about \{you, school, and your plans for the future/ him/her, his/her school, and his/her plans for the future\}. An interviewer will talk to you again in 2014. If you feel uncomfortable answering any questions, you can stop and nothing bad will happen to you. The information you provide will be kept confidential. All reports will be in summary form only \{your/\{NAME\}'s\} name will never be used. There are no special risks if you take part in this study.

Your parent or legal guardian has agreed for you to be in this study, but we are asking for your permission, as well.
We'll mail you a letter describing what we just discussed, so you have it for your records. Do you agree to take part in this interview?

AGREED - CONTINUE .1

IF NEEDED: \{You/he/she\} can also visit our website at: http://ies.ed.gov/ncee/nlts.

\section*{Appendix C. Skip logic errors in the surveys}

The study team identified skip logic errors affecting the 43 variables presented in table C-1. Each row of the table represents a survey variable with a skip logic programming error. The four columns represent the four versions of the survey instruments (see chapter 3). The cells in the table contain the number of observations with a skip logic error for the survey variable identified in the row and the survey version identified in the column. For example, the number of skip logic errors for variable B5 was 438 in Version 1 of the survey. In the analysis of item response rates, these skip logic errors are considered missing values.

Table C-1. Number of skip logic errors, by item and survey version

!=interpret data with caution. Estimate is unstable because the standard error represents more than 30 percent of the estimate; \#=Estimate rounds to zero; \(\dagger=\) Not applicable; na=Not applicable.
\({ }^{1}\) The base weight is the sampling weight for each youth in the sample and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{2}\) The analytic weight adjusts the base weight for parent survey nonresponse and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{3}\) Estimated bias is calculated as the weighted nonresponse rate times the difference in the weighted respondent and non-respondent percent. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{4}\) The relative bias is calculated as the estimated bias divided by the (before adjustments) overall percent of row characteristics.
\({ }^{5}\) Estimated bias is calculated as the difference in the weighted overall percent before and after the adjustments for nonresponse. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.

Small districts contained an estimated 30-199 age-eligible students with an IEP. Medium districts contained an estimated 200-374 age-eligible students with an IEP. Large districts contained an estimated 375 or more age-eligible students with an IEP. The estimated age-eligible IEP student counts were developed from \(2008-2009\) Common Core of Data from the U.S. Department of Education's National Center for Education Statistics. Special schools are state-sponsored special schools serving students who are blind and/or deaf.
\({ }^{7}\) A reportable program is a program within a school that may be self-contained, but does not have its own principal.
\({ }^{8}\) City areas are the territories inside urbanized areas and inside principal cities. Suburb areas are the territories outside principal cities and inside urbanized areas. Town areas are the territories inside urban clusters but outside urbanized areas. Rural areas are the Census-defined rural territories outside of urbanized areas as well as urban clusters.
\({ }^{9}\) A small number of cases (less than 0.3 percent) known to have been suspended but without data on the number of extensions were included in this group

\end{tabular}
!=interpret data with caution. Estimate is unstable because the standard error represents more than 30 percent of the estimate; \#=Estimate rounds to zero; \(\dagger=\) Not applicable; na=Not applicable. \({ }^{1}\) The base weight is the sampling weight for each youth in the sample and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{2}\) The analytic weight adjusts the base weight for parent survey nonresponse and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{3}\) Estimated bias is calculated as the weighted nonresponse rate times the difference in the weighted respondent and non-respondent percent. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{4}\) The relative bias is calculated as the estimated bias divided by the (before adjustments) overall percent of row characteristics
\({ }^{5}\) Estimated bias is calculated as the difference in the weighted overall percent before and after the adjustments for nonresponse. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{6}\) Small districts contained an estimated 30-199 age-eligible students with an IEP. Medium districts contained an estimated 200-374 age-eligible students with an IEP. Large districts contained an estimated 375 or more age-eligible students with an IEP. The estimated age-eligible IEP student counts were developed from 2008-2009 Common Core of Data from the U.S. Department of Education's National Center for Education Statistics. Special schools are state-sponsored special schools serving students who are blind and/or deaf.
\({ }^{7}\) A reportable program is a program within a school that may be self-contained, but does not have its own principal.
\({ }^{8}\) City areas are the territories inside urbanized areas and inside principal cities. Suburb areas are the territories outside principal cities and inside urbanized areas. Town areas are the territories inside urban clusters but outside urbanized areas. Rural areas are the Census-defined rural territories outside of urbanized areas as well as urban clusters.
\({ }^{9}\) A small number of cases (less than 0.3 percent) known to have been suspended but without data on the number of extensions were included in this group.

\end{tabular}
!=interpret data with caution. Estimate is unstable because the standard error represents more than 30 percent of the estimate; \#=Estimate rounds to zero; \(\dagger=\) Not applicable; na=Not applicable.
\({ }^{1}\) The base weight is the sampling weight for each youth in the sample and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{2}\) The analytic weight adjusts the base weight for parent survey nonresponse and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{3}\) Estimated bias is calculated as the weighted nonresponse rate times the difference in the weighted respondent and non-respondent percent. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{4}\) The relative bias is calculated as the estimated bias divided by the (before adjustments) overall percent of row characteristics.
\({ }^{5}\) Estimated bias is calculated as the difference in the weighted overall percent before and after the adjustments for nonresponse. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{6}\) Small districts contained an estimated 30-199 age-eligible students with an IEP. Medium districts contained an estimated 200-374 age-eligible students with an IEP. Large districts contained an estimated 375 or more age-eligible students with an IEP. The estimated age-eligible IEP student counts were developed from 2008 -2009 Common Core of Data from the U.S. Department of Education's National Center for Education Statistics. Special schools are state-sponsored special schools serving students who are blind and/or deaf.
\({ }^{7}\) A reportable program is a program within a school that may be self-contained, but does not have its own principal.
\({ }^{8}\) City areas are the territories inside urbanized areas and inside principal cities. Suburb areas are the territories outside principal cities and inside urbanized areas. Town areas are the territories inside urban clusters but outside urbanized areas. Rural areas are the Census-defined rural territories outside of urbanized areas as well as urban clusters.
\({ }^{9}\) A small number of cases (less than 0.3 percent) known to have been suspended but without data on the number of extensions were included in this group.
Source: National Longitudinal Transition Study 2012, data from parent and youth data collection and Common Core Data for school year 2008 -2009.

!=interpret data with caution. Estimate is unstable because the standard error represents more than 30 percent of the estimate; \#=Estimate rounds to zero; \(\dagger=\) Not applicable; na=Not applicable. \({ }^{1}\) The base weight is the sampling weight for each youth in the sample and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{2}\) The analytic weight adjusts the base weight for parent survey nonresponse and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{3}\) Estimated bias is calculated as the weighted nonresponse rate times the difference in the weighted respondent and non-respondent percent. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{4}\) The relative bias is calculated as the estimated bias divided by the (before adjustments) overall percent of row characteristics.
 from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{6}\) Small districts contained an estimated 30-199 age-eligible students with an IEP. Medium districts contained an estimated 200-374 age-eligible students with an IEP. Large districts contained an estimated 375 or more age-eligible students with an IEP. The estimated age-eligible IEP student counts were developed from \(2008-2009\) Common Core of Data from the U.S. Department of Education's National Center for Education Statistics. Special schools are state-sponsored special schools serving students who are blind and/or deaf.
\({ }^{7}\) A reportable program is a program within a school that may be self-contained, but does not have its own principal.
\({ }^{8}\) City areas are the territories inside urbanized areas and inside principal cities. Suburb areas are the territories outside principal cities and inside urbanized areas. Town areas are the territories inside urban clusters but outside urbanized areas. Rural areas are the Census-defined rural territories outside of urbanized areas as well as urban clusters.
\({ }^{9}\) A small number of cases (less than 0.3 percent) known to have been suspended but without data on the number of extensions were included in this group.
Source: National Longitudinal Transition Study 2012, data from parent and youth data collection and Common Core Data for school year 2008 -2009.

\end{tabular}
!=interpret data with caution. Estimate is unstable because the standard error represents more than 30 percent of the estimate; \#=Estimate rounds to zero; \(\dagger=\) Not applicable; na=Not applicable. \({ }^{1}\) The base weight is the sampling weight for each youth in the sample and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{2}\) The analytic weight adjusts the base weight for parent survey nonresponse and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{3}\) Estimated bias is calculated as the weighted nonresponse rate times the difference in the weighted respondent and non-respondent percent. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{4}\) The relative bias is calculated as the estimated bias divided by the (before adjustments) overall percent of row characteristics.
 from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{6}\) Small districts contained an estimated 30-199 age-eligible students with an IEP. Medium districts contained an estimated 200-374 age-eligible students with an IEP. Large districts contained an estimated 375 or more age-eligible students with an IEP. The estimated age-eligible IEP student counts were developed from \(2008-2009\) Common Core of Data from the U.S. Department of Education's National Center for Education Statistics. Special schools are state-sponsored special schools serving students who are blind and/or deaf.
\({ }^{7}\) A reportable program is a program within a school that may be self-contained, but does not have its own principal.
\({ }^{8}\) City areas are the territories inside urbanized areas and inside principal cities. Suburb areas are the territories outside principal cities and inside urbanized areas. Town areas are the territories inside urban clusters but outside urbanized areas. Rural areas are the Census-defined rural territories outside of urbanized areas as well as urban clusters.
\({ }^{9}\) A small number of cases (less than 0.3 percent) known to have been suspended but without data on the number of extensions were included in this group.
Source: National Longitudinal Transition Study 2012, data from parent and youth data collection and Common Core Data for school year 2008 -2009.

\end{tabular}
!=interpret data with caution. Estimate is unstable because the standard error represents more than 30 percent of the estimate; \#=Estimate rounds to zero; \(\dagger=\) Not applicable; na=Not applicable. \({ }^{1}\) The base weight is the sampling weight for each youth in the sample and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{2}\) The analytic weight adjusts the base weight for parent survey nonresponse and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{3}\) Estimated bias is calculated as the weighted nonresponse rate times the difference in the weighted respondent and non-respondent percent. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{4}\) The relative bias is calculated as the estimated bias divided by the (before adjustments) overall percent of row characteristics.
 from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{6}\) Small districts contained an estimated 30-199 age-eligible students with an IEP. Medium districts contained an estimated 200-374 age-eligible students with an IEP. Large districts contained an estimated 375 or more age-eligible students with an IEP. The estimated age-eligible IEP student counts were developed from \(2008-2009\) Common Core of Data from the U.S. Department of Education's National Center for Education Statistics. Special schools are state-sponsored special schools serving students who are blind and/or deaf.
\({ }^{7}\) A reportable program is a program within a school that may be self-contained, but does not have its own principal.
\({ }^{8}\) City areas are the territories inside urbanized areas and inside principal cities. Suburb areas are the territories outside principal cities and inside urbanized areas. Town areas are the territories inside urban clusters but outside urbanized areas. Rural areas are the Census-defined rural territories outside of urbanized areas as well as urban clusters.
\({ }^{9}\) A small number of cases (less than 0.3 percent) known to have been suspended but without data on the number of extensions were included in this group.
Source: National Longitudinal Transition Study 2012, data from parent and youth data collection and Common Core Data for school year 2008 -2009.

!=interpret data with caution. Estimate is unstable because the standard error represents more than 30 percent of the estimate; \#=Estimate rounds to zero; \(\dagger=\) Not applicable; na=Not applicable.
\({ }^{1}\) The base weight is the sampling weight for each youth in the sample and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{2}\) The analytic weight adjusts the base weight for youth survey nonresponse and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{3}\) Estimated bias is calculated as the weighted nonresponse rate times the difference in the weighted respondent and non-respondent percent. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{4}\) The relative bias is calculated as the estimated bias divided by the (before adjustments) overall percent of row characteristics.
\({ }^{5}\) Estimated bias is calculated as the difference in the weighted overall percent before and after the adjustments for nonresponse. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.

6 Small districts contained an estimated 30-199 age-eligible students with an IEP. Medium districts contained an estimated 200-374 age-eligible students with an IEP. Large districts contained an estimated 375 or more age-eligible students with an IEP. The estimated age-eligible IEP student counts were developed from \(2008-2009\) Common Core of Data from the U.S. Department of Education's National Center for Education Statistics. Special schools are state-sponsored special schools serving students who are blind and/or deaf
\({ }^{7}\) A reportable program is a program within a school that may be self-contained, but does not have its own principal.
\({ }^{8}\) City areas are the territories inside urbanized areas and inside principal cities. Suburb areas are the territories outside principal cities and inside urbanized areas. Town areas are the territories inside urban clusters but outside urbanized areas. Rural areas are the Census-defined rural territories outside of urbanized areas as well as urban clusters.
\({ }^{9}\) A small number of cases (less than 0.3 percent) known to have been suspended but without data on the number of extensions were included in this group.
Source: National Longitudinal Transition Study 2012, data from parent and youth data collection and Common Core Data for school year 2008 -2009.

!=interpret data with caution. Estimate is unstable because the standard error represents more than 30 percent of the estimate; \#=Estimate rounds to zero; \(\dagger=\) Not applicable; na=Not applicable.
\({ }^{1}\) The base weight is the sampling weight for each youth in the sample and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{2}\) The analytic weight adjusts the base weight for youth survey nonresponse and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{3}\) Estimated bias is calculated as the weighted nonresponse rate times the difference in the weighted respondent and non-respondent percent. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{4}\) The relative bias is calculated as the estimated bias divided by the (before adjustments) overall percent of row characteristics.
\({ }^{5}\) Estimated bias is calculated as the difference in the weighted overall percent before and after the adjustments for nonresponse. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{6}\) Small districts contained an estimated 30-199 age-eligible students with an IEP. Medium districts contained an estimated 200-374 age-eligible students with an IEP. Large districts contained an estimated 375 or more age-eligible students with an IEP. The estimated age-eligible IEP student counts were developed from \(2008-2009\) Common Core of Data from the U.S. Department of Education's National Center for Education Statistics. Special schools are state-sponsored special schools serving students who are blind and/or deaf.
\({ }^{7}\) A reportable program is a program within a school that may be self-contained, but does not have its own principal.
\({ }^{8}\) City areas are the territories inside urbanized areas and inside principal cities. Suburb areas are the territories outside principal cities and inside urbanized areas. Town areas are the territories inside urban clusters but outside urbanized areas. Rural areas are the Census-defined rural territories outside of urbanized areas as well as urban clusters.
\({ }^{9}\) A small number of cases (less than 0.3 percent) known to have been suspended but without data on the number of extensions were included in this group.
Source: National Longitudinal Transition Study 2012, data from parent and youth data collection and Common Core Data for school year 2008 -2009.

!=interpret data with caution. Estimate is unstable because the standard error represents more than 30 percent of the estimate; \#=Estimate rounds to zero; \(\dagger=\) Not applicable; na=Not applicable.
\({ }^{1}\) The base weight is the sampling weight for each youth in the sample and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{2}\) The analytic weight adjusts the base weight for youth survey nonresponse and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{3}\) Estimated bias is calculated as the weighted nonresponse rate times the difference in the weighted respondent and non-respondent percent. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{4}\) The relative bias is calculated as the estimated bias divided by the (before adjustments) overall percent of row characteristics.
 from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{6}\) Small districts contained an estimated 30-199 age-eligible students with an IEP. Medium districts contained an estimated 200-374 age-eligible students with an IEP. Large districts contained an estimated 375 or more age-eligible students with an IEP. The estimated age-eligible IEP student counts were developed from \(2008-2009\) Common Core of Data from the U.S. Department of Education's National Center for Education Statistics. Special schools are state-sponsored special schools serving students who are blind and/or deaf
\({ }^{7}\) A reportable program is a program within a school that may be self-contained, but does not have its own principal.
\({ }^{8}\) City areas are the territories inside urbanized areas and inside principal cities. Suburb areas are the territories outside principal cities and inside urbanized areas. Town areas are the territories inside urban clusters but outside urbanized areas. Rural areas are the Census-defined rural territories outside of urbanized areas as well as urban clusters.
\({ }^{9}\) A small number of cases (less than 0.3 percent) known to have been suspended but without data on the number of extensions were included in this group.
Source: National Longitudinal Transition Study 2012, data from parent and youth data collection and Common Core Data for school year 2008 -2009.

\({ }^{3}\) Estimated bias is calculated as the weighted nonresponse rate times the difference in the weighted respondent and non-respondent percent. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{4}\) The relative bias is calculated as the estimated bias divided by the (before adjustments) overall percent of row characteristics.
\({ }^{5}\) Estimated bias is calculated as the difference in the weighted overall percent before and after the adjustments for nonresponse. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{6}\) Small districts contained an estimated 30-199 age-eligible students with an IEP. Medium districts contained an estimated 200-374 age-eligible students with an IEP. Large districts contained an estimated 375 or more age-eligible students with an IEP. The estimated age-eligible IEP student counts were developed from 2008-2009 Common Core of Data from the U.S. Department of Education's National Center for Education Statistics. Special schools are state-sponsored special schools serving students who are blind and/or deaf
\({ }^{7}\) A reportable program is a program within a school that may be self-contained, but does not have its own principal.
\({ }^{8}\) City areas are the territories inside urbanized areas and inside principal cities. Suburb areas are the territories outside principal cities and inside urbanized areas. Town areas are the territories inside urban clusters but outside urbanized areas. Rural areas are the Census-defined rural territories outside of urbanized areas as well as urban clusters.
\({ }^{9}\) A small number of cases (less than 0.3 percent) known to have been suspended but without data on the number of extensions were included in this group.

!=interpret data with caution. Estimate is unstable because the standard error represents more than 30 percent of the estimate; \#=Estimate rounds to zero; \(\dagger=\) Not applicable; na=Not applicable.
\({ }^{1}\) The base weight is the sampling weight for each youth in the sample and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{2}\) The analytic weight adjusts the base weight for youth survey nonresponse and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{3}\) Estimated bias is calculated as the weighted nonresponse rate times the difference in the weighted respondent and non-respondent percent. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{4}\) The relative bias is calculated as the estimated bias divided by the (before adjustments) overall percent of row characteristics.
\({ }^{5}\) Estimated bias is calculated as the difference in the weighted overall percent before and after the adjustments for nonresponse. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{6}\) Small districts contained an estimated 30-199 age-eligible students with an IEP. Medium districts contained an estimated 200-374 age-eligible students with an IEP. Large districts contained an estimated 375 or more age-eligible students with an IEP. The estimated age-eligible IEP student counts were developed from \(2008-2009\) Common Core of Data from the U.S. Department of Education's National Center for Education Statistics. Special schools are state-sponsored special schools serving students who are blind and/or deaf.
\({ }^{7}\) A reportable program is a program within a school that may be self-contained, but does not have its own principal.
\({ }^{8}\) City areas are the territories inside urbanized areas and inside principal cities. Suburb areas are the territories outside principal cities and inside urbanized areas. Town areas are the territories inside urban clusters but outside urbanized areas. Rural areas are the Census-defined rural territories outside of urbanized areas as well as urban clusters.
\({ }^{9}\) A small number of cases (less than 0.3 percent) known to have been suspended but without data on the number of extensions were included in this group.
Source: National Longitudinal Transition Study 2012, data from parent and youth data collection and Common Core Data for school year 2008 -2009.

!=interpret data with caution. Estimate is unstable because the standard error represents more than 30 percent of the estimate; \#=Estimate rounds to zero; \(\dagger=\) Not applicable; na=Not applicable.
\({ }^{1}\) The base weight is the sampling weight for each youth in the sample and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{2}\) The analytic weight adjusts the base weight for youth survey nonresponse and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{3}\) Estimated bias is calculated as the weighted nonresponse rate times the difference in the weighted respondent and non-respondent percent. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{4}\) The relative bias is calculated as the estimated bias divided by the (before adjustments) overall percent of row characteristics.
\({ }^{5}\) Estimated bias is calculated as the difference in the weighted overall percent before and after the adjustments for nonresponse. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{6}\) Small districts contained an estimated 30-199 age-eligible students with an IEP. Medium districts contained an estimated 200-374 age-eligible students with an IEP. Large districts contained an estimated 375 or more age-eligible students with an IEP. The estimated age-eligible IEP student counts were developed from 2008-2009 Common Core of Data from the U.S. Department of Education's National Center for Education Statistics. Special schools are state-sponsored special schools serving students who are blind and/or deaf
\({ }^{7}\) A reportable program is a program within a school that may be self-contained, but does not have its own principal.
\({ }^{8}\) City areas are the territories inside urbanized areas and inside principal cities. Suburb areas are the territories outside principal cities and inside urbanized areas. Town areas are the territories inside urban clusters but outside urbanized areas. Rural areas are the Census-defined rural territories outside of urbanized areas as well as urban clusters.
\({ }^{9}\) A small number of cases (less than 0.3 percent) known to have been suspended but without data on the number of extensions were included in this group.
Source: National Longitudinal Transition Study 2012, data from parent and youth data collection and Common Core Data for school year 2008-2009.

\end{tabular}
\(!=\) interpret data with caution. Estimate is unstable because the standard error represents more than 30 percent of the estimate; \#=Estimate rounds to zero; \(\dagger=\) Not applicable; na=Not applicable.
\({ }^{1}\) The base weight is the sampling weight for each youth in the sample and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{2}\) The analytic weight adjusts the base weight for youth survey nonresponse and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{3}\) Estimated bias is calculated as the weighted nonresponse rate times the difference in the weighted respondent and non-respondent percent. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{4}\) The relative bias is calculated as the estimated bias divided by the (before adjustments) overall percent of row characteristics
\({ }^{5}\) Estimated bias is calculated as the difference in the weighted overall percent before and after the adjustments for nonresponse. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{6}\) Small districts contained an estimated 30-199 age-eligible students with an IEP. Medium districts contained an estimated 200-374 age-eligible students with an IEP. Large districts contained an estimated 375 or more age-eligible students with an IEP. The estimated age-eligible IEP student counts were developed from 2008-2009 Common Core of Data from the U.S. Department of Education's National Center for Education Statistics. Special schools are state-sponsored special schools serving students who are blind and/or deaf.
\({ }^{7}\) A reportable program is a program within a school that may be self-contained, but does not have its own principal.
\({ }^{8}\) City areas are the territories inside urbanized areas and inside principal cities. Suburb areas are the territories outside principal cities and inside urbanized areas. Town areas are the territories inside urban clusters but outside urbanized areas. Rural areas are the Census-defined rural territories outside of urbanized areas as well as urban clusters.
\({ }^{9}\) A small number of cases (less than 0.3 percent) known to have been suspended but without data on the number of extensions were included in this group.
Source: National Longitudinal Transition Study 2012, data from parent and youth data collection and Common Core Data for school year 2008 -2009.

!=interpret data with caution. Estimate is unstable because the standard error represents more than 30 percent of the estimate; \#=Estimate rounds to zero; \(\dagger=\) Not applicable; na=Not applicable.
\({ }^{1}\) The base weight is the sampling weight for each youth in the sample and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{2}\) The analytic weight adjusts the base weight for youth survey nonresponse and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{3}\) Estimated bias is calculated as the weighted nonresponse rate times the difference in the weighted respondent and non-respondent percent. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{4}\) The relative bias is calculated as the estimated bias divided by the (before adjustments) overall percent of row characteristics.
\({ }^{5}\) Estimated bias is calculated as the difference in the weighted overall percent before and after the adjustments for nonresponse. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{6}\) Small districts contained an estimated 30-199 age-eligible students with an IEP. Medium districts contained an estimated 200-374 age-eligible students with an IEP. Large districts contained an estimated 375 or more age-eligible students with an IEP. The estimated age-eligible IEP student counts were developed from 2008-2009 Common Core of Data from the U.S. Department of Education's National Center for Education Statistics. Special schools are state-sponsored special schools serving students who are blind and/or deaf.
\({ }^{7}\) A reportable program is a program within a school that may be self-contained, but does not have its own principal.
\({ }^{8}\) City areas are the territories inside urbanized areas and inside principal cities. Suburb areas are the territories outside principal cities and inside urbanized areas. Town areas are the territories inside urban clusters but outside urbanized areas. Rural areas are the Census-defined rural territories outside of urbanized areas as well as urban clusters.
\({ }^{9}\) A small number of cases (less than 0.3 percent) known to have been suspended but without data on the number of extensions were included in this group.

!=interpret data with caution. Estimate is unstable because the standard error represents more than 30 percent of the estimate; \#=Estimate rounds to zero; \(\dagger=\) Not applicable; na=Not applicable.
\({ }^{1}\) The base weight is the sampling weight for each youth in the sample and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{2}\) The analytic weight adjusts the base weight for youth survey nonresponse and is post-stratified to population counts of students with an IEP in each IDEA disability category and of students without an IEP.
\({ }^{3}\) Estimated bias is calculated as the weighted nonresponse rate times the difference in the weighted respondent and non-respondent percent. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{4}\) The relative bias is calculated as the estimated bias divided by the (before adjustments) overall percent of row characteristics.
\({ }^{5}\) Estimated bias is calculated as the difference in the weighted overall percent before and after the adjustments for nonresponse. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.
\({ }^{6}\) Small districts contained an estimated 30-199 age-eligible students with an IEP. Medium districts contained an estimated 200-374 age-eligible students with an IEP. Large districts contained an estimated 375 or more age-eligible students with an IEP. The estimated age-eligible IEP student counts were developed from 2008-2009 Common Core of Data from the U.S. Department of Education's National Center for Education Statistics. Special schools are state-sponsored special schools serving students who are blind and/or deaf.
\({ }^{7}\) A reportable program is a program within a school that may be self-contained, but does not have its own principal.
\({ }^{8}\) City areas are the territories inside urbanized areas and inside principal cities. Suburb areas are the territories outside principal cities and inside urbanized areas. Town areas are the territories inside urban clusters but outside urbanized areas. Rural areas are the Census-defined rural territories outside of urbanized areas as well as urban clusters.
\({ }^{9}\) A small number of cases (less than 0.3 percent) known to have been suspended but without data on the number of extensions were included in this group.

!=interpret data with caution. Estimate is unstable because the standard error represents more than 30 percent of the estimate; \#=Estimate rounds to zero; \(\dagger=\) Not applicable.
Notes: Percent estimated for total, respondents, and non-respondents were calculated with the analytic weight after adjustments for parent survey nonresponse. Estimated bias is calculated as the weighted nonresponse rate times the difference in the weighted respondent and non-respondent means. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.

\end{tabular}
!=interpret data with caution. Estimate is unstable because the standard error represents more than 30 percent of the estimate; \#=Estimate rounds to zero; \(\dagger=\) Not applicable.
Notes: Percent estimated for total, respondents, and non-respondents were calculated with the analytic weight after adjustments for parent survey nonresponse. Estimated bias is calculated as the weighted nonresponse rate times the difference in the weighted respondent and non-respondent means. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.

\end{tabular}
\(!=\) interpret data with caution. Estimate is unstable because the standard error represents more than 30 percent of the estimate; \#=Estimate rounds to zero; \(\dagger=\) Not applicable.
Notes: Percent estimated for total, respondents, and non-respondents were calculated with the analytic weight after adjustments for youth survey nonresponse. Estimated bias is calculated as the weighted nonresponse rate times the difference in the weighted respondent and non-respondent means. Values of estimated bias that are statistically significantly different from zero at the .05 level are indicated by a Yes value in the Statistically significant column.

```

[^0]:    ${ }^{1}$ Because youth with deafness and hearing impairments are small groups, they have been combined into one group for this study.

[^1]:    ${ }^{2}$ This criterion limited the costs of data collection and the burden on small districts. It led to the exclusion of districts with about 450,000 (2 percent) of all students in the target population (figure ES.1).

[^2]:    ${ }^{3}$ Because youth with deafness and hearing impairments are small groups, they have been combined into one group for this study.
    ${ }^{4}$ Section 504 is a civil rights statute that bars the exclusion of individuals from programs and activities that receive federal assistance based on having (or having a history of) a physical or mental impairment that substantially limits major life activities. The definition of a disability is broader under Section 504 than under IDEA, which requires disabilities to adversely affect students' educational performance.

[^3]:    ${ }^{5}$ The NLTS 2012 did not include about 300,000 students who attended schools run by the Department of Defense, the Bureau of Indian Affairs, or in the territories. Total enrollment data are for the 2007-2008 school year.
    ${ }^{6}$ National data on the number of students with 504 plans available from the U.S. Department of Education Office of Civil Rights do not separately identify students by grade or age range in a way that would support an estimate of students in this group who are 13 to 21 . The estimate of 2 percent is based on the findings of a survey reported in Holler \& Zirkel (2008).

[^4]:    ${ }^{7}$ The study was not designed to make separate estimates for charter schools.
    8 "Rural, distant" is a Census-defined rural area that is more than 5 miles but fewer than or equal to 25 miles from an urbanized area and is more than 2.5 miles but fewer than or equal to 10 miles from an urban cluster. "Rural, remote" is a Census-defined rural area that is more than 25 miles from an urbanized area and is more than 10 miles from an urban cluster (Sable and Plotts, 2010).

[^5]:    ${ }^{9}$ Some districts had special requirements for student and school participation, such as requiring active parental consent before the district would provide contact information, which would have substantially depressed response rates. Rather than having an unacceptably low response rate in a district, the study treated those districts as nonparticipating and computed an adjustment to the district weights to address district nonparticipation (see chapter 6).

[^6]:    ${ }^{10}$ Sampling larger numbers of youth from disability groups that are more prevalent in the population also helped to obtain precise estimates for the overall population of youth with an IEP, relative to sampling equal numbers of youth across groups regardless of their prevalence.

[^7]:    ${ }^{11}$ The RUF variable c_complete distinguishes survey respondents and nonrespondents. Values of 1 and 2 indicate parent survey respondents, and values of 1 and 3 indicate a youth survey respondents.

[^8]:    ${ }^{12}$ The CHAID procedure iteratively segments a sample, creating a hierarchy of subgroups that are distinguished based

[^9]:    ${ }^{14}$ EDFacts is an ED initiative to collect and promote the use of high quality, kindergarten through grade 12 ( $\mathrm{K}-12$ ) performance data for use in education planning, policymaking, and management and budget decision making to improve outcomes for students.

[^10]:    ${ }^{15}$ See http://www.rti.org/sudaan/, the current version of the SAS/STAT User's Guide at http://support.sas.com/software/products/stat/index.html, and http://www.stata.com.

[^11]:    ${ }^{16}$ The HSLS base-year data file documentation provides more detail (Ingels et al., 2011).

[^12]:    ${ }^{19}$ This variable includes imputed values for 6 percent of parent survey respondents (see chapter 8).

[^13]:    ${ }^{20}$ The set of comparisons were based on all results provided in the appendices of these two report volumes.

[^14]:    ${ }^{21}$ Unlike the case in Volume 1, the appendices to Volume 2 only analyze dichotomized versions of many categorical variables because of the larger number of groups being compared. This is the primary reason why the number of between-group comparisons in Volume 2 is not dramatically larger than in Volume 1. For example, the Volume 2 analysis of several survey items about youth perceptions of school focuses on the proportions of youth who "agree a lot or a little" compared with responses of "disagree a lot or a little."

[^15]:    ${ }^{22}$ Similar or lower risk than all youth with an IEP is defined in Volume 2 as not being at higher risk on at least three of the seven measures.

[^16]:    ${ }^{23}$ The imputation model uses age-equivalents when parent respondents provide the youth's grade instead of the age.

[^17]:    ${ }^{24}$ For example, the report excludes measures on the reasons youth left school for those who had because the analyses focus on youth still enrolled in secondary education. It also excludes parent-reported youth disabilities because the report uses information provided by the districts instead (although these measures affect skip logic in the surveys).

[^18]:    ${ }^{25}$ Internal consistency is an indicator of how closely related the components of an index are to each other. It is measured by Cronbach's alpha, a value between 0 and 1 where higher values indicate greater internal consistency.

[^19]:    ${ }^{1}$ If A13=6, Abbrev_P $=1$, indicating the youth conducted an abbreviated version of the parent survey.

[^20]:    ${ }^{2}$ For respondent privacy concerns, these responses grouped with code 9 in file.

[^21]:    ${ }^{3}$ For respondent privacy concerns, these responses grouped with code 4 in file.

[^22]:    ${ }^{4}$ Code 0=Kindergarten Code 98=PreKindergarten

[^23]:    ${ }^{5}$ Code 0=Kindergarten Code 98=PreKindergarten
    ${ }^{6}$ Code 0=Kindergarten Code 98=PreKindergarten

[^24]:    ${ }^{7}$ Code $0=$ Kindergarten Code $98=$ PreKindergarten

[^25]:    ${ }^{8}$ Code $0=$ Kindergarten Code $98=$ PreKindergarten

[^26]:    ${ }^{9}$ Responses grouped into Other category (99).

[^27]:    ${ }^{10}$ Responses combined with Asian (G3_02) in file
