Cooperative Integrated Reading and Composition®

Program description

Cooperative Integrated Reading and Composition® (CIRC) is a comprehensive reading and writing program for students in grades 2 through 8. It includes story-related activities, direct instruction in reading comprehension, and integrated reading and language arts activities. Pairs of students (grouped either by or across ability levels) read to each other, predict how stories will end, summarize stories, write responses, and practice spelling, decoding, and vocabulary. Within cooperative teams of four, students work to understand the main idea of a story and work through the writing process. The CIRC® process includes teacher instruction, team practice, peer assessment, and team/partner recognition. A Spanish version of the program was also designed for grades 2–5.

Research

Two studies of CIRC® met the WWC evidence standards with reservations. They included over 700 third-grade students in Ohio and Texas. The WWC considers the extent of evidence for CIRC® to be moderate to large for comprehension. No studies that met WWC evidence standards with or without reservations addressed alphatics, fluency, or general reading achievement.

Effectiveness

The CIRC® program was found to have no discernible effects for comprehension.

1. The descriptive information for this program was obtained from publicly available sources: the research literature (Bramlett, 1994; Skeans, 1991). The WWC requests developers to review the program description sections for accuracy from their perspective. Further verification of the accuracy of the descriptive information for this program is beyond the scope of this review.

2. The What Works Clearinghouse (WWC) reviewed the effects of Bilingual CIRC on the reading achievement of English language learners and the findings are reported in a separate WWC intervention report.

3. The evidence presented in this report is based on available research. Findings and conclusions may change as new research becomes available.
Developer and contact
Developed by the Center for Social Organization of Schools at The Johns Hopkins University, Cooperative Integrated Reading and Composition® is distributed by the Success for All Foundation, Inc. Address: 200 W. Towsontown Boulevard, Baltimore, MD 21204-5200. Email: sfainfo@successforall.org. Web: http://www.successforall.net/elementary/readingwings.htm. Telephone: (800) 548-4998 ext. 2372.

Scope of use
CIRC® was developed in 1983 by Bob Slavin and Nancy Madden. In 1985 CIRC® was used as part of a cooperative elementary whole-school model. The program was reformulated as Reading Roots (beginning readers) and Reading Wings (upper elementary), and is both a component of the Success for All comprehensive school reform model and a stand-alone reading program.

Research
Eleven studies reviewed by the WWC investigated the effects of CIRC®. Two studies (Bramlett, 1994; Skeans, 1991) were quasi-experimental designs that met WWC evidence standards with reservations. The remaining nine studies did not meet WWC evidence screens.

Met evidence standards with reservations
Bramlett (1994) included 392 third-graders from 18 classrooms in eight school districts in rural southern Ohio. CIRC® was implemented in the intervention classrooms as the core reading curriculum. The comparison classrooms received their regular reading curriculum.

Skeans (1991) is a study of the third-grade classrooms in a suburban district of Houston, Texas. Twenty-four third-grade teachers were matched on students’ achievement and other factors and assigned to two conditions. In all, 169 students in the intervention group used CIRC® for 18 weeks along with the integrated language arts, and 141 students in the comparison group experienced only the integrated language arts curriculum.

Teaching
The program uses daily 90-minute lessons to focus on story-related activities, direct instruction in reading comprehension, and integrated reading and language arts activities. In a team setting, pairs of mixed-ability students work together to read, discuss their reading to clarify unknown vocabulary, re-read for fluency, understand the main idea, comprehend stories, and work through the writing process (draft, revise, and edit each other’s writing). Students are rewarded based on the basis of the whole team’s performance to provide motivation for peer work. Teams are rewarded based on the sum of team members’ performance on these assessments, creating motivation for peer teaching.

Teacher training includes a two-day session that covers word structure and phonics, vocabulary development, fluency, and comprehension skills as well as program management and cooperative learning strategies. Technical support through telephone conference or on-site visits is also provided.

Cost
The cost of the program is approximately $150 per student for training and materials, depending on school size and number of schools participating together.

4. These numbers show the average and range of improvement indices for all findings across the study.
5. Students in intervention classes were given only the reading components of Cooperative Integrated Reading and Composition®.
**Research (continued)**

**Extent of evidence**
The WWC categorizes the extent of evidence in each domain as small or moderate to large (see the What Works Clearinghouse Extent of Evidence Categorization Scheme). The extent of evidence takes into account the number of studies and the total sample size across the studies that met WWC evidence standards with or without reservations. The WWC considers the extent of evidence for CIRC® to be moderate to large for comprehension. No studies that met WWC evidence standards with or without reservations addressed alphabetic, fluency, or general reading achievement.

---

**Effectiveness**

**Findings**
The WWC review of interventions for beginning reading addresses student outcomes in four domains: alphabetic, fluency, comprehension; and general reading achievement. The studies included in this report covers only the comprehension domain. Within comprehension, results for two constructs, vocabulary development and reading comprehension, are reported. The findings below present the authors’ estimates and WWC-calculated estimates of the size and the statistical significance of the effects of CIRC® on students.

*Comprehension.* For reading comprehension, Bramlett (1994) reported a statistically significant positive effect of CIRC® on the Reading Comprehension subtest of the California Achievement Test (CAT). According to WWC calculations, the effect was not statistically significant. For vocabulary, the study authors did not find statistically significant effects of CIRC® on the CAT Word Analysis subtest nor on the CAT Reading Vocabulary subtest. The WWC found that the average effect size across the three comprehension outcomes was neither statistically significant nor large enough to be substantively important according to WWC criteria (that is, an effect size at least 0.25).

For reading comprehension, Skeans (1991) did not find a statistically significant effect of CIRC® on the Metropolitan Achievement Test (MAT) Reading Comprehension subtest. For vocabulary, the study author reported a statistically significant positive effect on the Vocabulary subtest of the MAT. According to WWC calculations, the effect was not statistically significant. The WWC found that the average effect size across the two outcomes was neither statistically significant nor large enough to be substantively important.

**Rating of effectiveness**
The WWC rates the effects of an intervention in a given outcome domain as: positive, potentially positive, mixed, no discernible effects, potentially negative, or negative. The rating of effectiveness takes into account four factors: the quality of the research design, the statistical significance of the findings, the size of the difference between participants in the intervention and the comparison conditions, and the consistency in findings across studies (see the WWC Intervention Rating Scheme).

---

6. The Extent of Evidence Categorization was developed to tell readers how much evidence was used to determine the intervention rating, focusing on the number and size of studies. Additional factors associated with a related concept, external validity, such as the students’ demographics and the types of settings in which studies took place, are not taken into account for the categorization.

7. For definitions of the domains, see the Beginning Reading Protocol.

8. The level of statistical significance was reported by the study authors or, where necessary, calculated by the WWC to correct for clustering within classrooms or schools and for multiple comparisons. For an explanation, see the WWC Tutorial on Mismatch. See Technical Details of WWC-Conducted Computations for the formulas the WWC used to calculate the statistical significance. In the case of CIRC®, corrections for clustering and multiple comparisons were needed.
Cooperative Integrated Reading and Composition®

July 16, 2007

WWC Intervention Report

The WWC found CIRC® to have no discernible effects on comprehension.

Improvement index

The WWC computes an improvement index for each individual finding. In addition, within each outcome domain, the WWC computes an average improvement index for each study and an average improvement index across studies (see Technical Details of WWC-Conducted Computations). The improvement index represents the difference between the percentile rank of the average student in the intervention condition versus the percentile rank of the average student in the comparison condition. Unlike the rating of effectiveness, the improvement index is based entirely on the size of the effect, regardless of the statistical significance of the effect, the study design, or the analyses. The improvement index can take on values between –50 and +50, with positive numbers denoting results favorable to the intervention group.

The average improvement index for comprehension is +4 percentile points in two studies, with a range of +1 to +8 percentile points across findings.

Summary

The WWC reviewed 11 studies on CIRC®. Two studies met WWC standards with reservations; the others did not meet WWC evidence screens. Based on the two studies, the WWC found no discernible effects in the comprehension domain. The evidence presented in this report may change as new research emerges.

References

Met WWC evidence standards with reservations

Did not meet WWC evidence screens

9. Intervention not relevant: the BCIRC intervention was designed to teach English to non-native speakers, which is not the focus of the Beginning Reading review.
10. Does not use a strong causal design: there was only one intervention and/or one comparison unit in each study condition, so the analysis could not separate the effects of the intervention from other factors.
11. The outcome measures are not shown to be valid or reliable: the outcome measures used in this study did not demonstrate adequate reliability or validity.
Complete data were not reported for the WWC to compute effect sizes for the third graders, the sample of interest to this review.

The sample is not appropriate to this review: the parameters for this WWC review specified that students should be in grades kindergarten through third grade; this study did not disaggregate students in the eligible range from those outside the range.

For more information about specific studies and WWC calculations, please see the WWC CIRC® Technical Appendices.
